

TECHNICAL REFERENCE

FLIR **BLACKFLY[®]S**

BFS-U3-13Y3

USB[™]
VISION

Revised 7/19/2017

FCC Compliance

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesirable operation.

Korean EMC Certification

The KCC symbol indicates that this product complies with Korea's Electrical Communication Basic Law regarding EMC testing for electromagnetic interference (EMI) and susceptibility (EMS).

Hardware Warranty

The warranty for the Blackfly S camera is 3 years. For detailed information on how to repair or replace your camera, please see the [terms and conditions on our website](#).

Export Control

The ECCN for this product is EAR099.

WEEE

The symbol indicates that this product may not be treated as household waste. Please ensure this product is properly disposed as inappropriate waste handling of this product may cause potential hazards to the environment and human health. For more detailed information about recycling of this product, please contact us.

Trademarks

Names and marks appearing on the products herein are either registered trademarks or trademarks of FLIR Systems, Inc. and/or its subsidiaries.

Licensing

To view the licenses of open source packages used in this product please see [What open source packages does firmware use?](#)

1 Blackfly S Technical Reference

Welcome to the Blackfly S camera. We offer a number of resources to assist you with the Blackfly S.

- **Release Notes**—information about the current firmware release including feature additions or changes, bug fixes, and known issues.
- **Specifications**—information about the camera model as it performs with the current firmware.
- **Getting Started**—quick start guide for installing the camera and software.
- **Installation Guide**—information about installing the camera and SDK, the physical interface and mechanical properties, troubleshooting and how to get help. This document is available as a PDF for download or as a webpage included in the firmware release package.
- **Technical Reference**—information about the features supported by the camera model with the current firmware, including: image format control, acquisition control, sequencing, binning/decimation, and others. This document is available as a PDF for download or as a webpage included in the firmware release package.
- **Firmware**—programming inserted into the programmable ROM of the camera that can be updated in-field. New firmware packages are available for download and include both the firmware file and documentation.
- **Spinnaker SDK**—software development kit that provides GenICam-compliant controls to create applications for the camera. Spinnaker is available for download. Each installation includes API documentation for C, C++, and C#.

Our website provides additional information in our [Knowledge Base](#) and [Technical Application Note](#) library. As well, the [Downloads](#) site is the portal to access documentation and firmware updates.

2 BFS-U3-13Y3 Specifications

2.1 General

	BFS-U3-13Y3M	BFS-U3-13Y3C
Firmware Version	1608.0.47.0	1608.0.47.0
Resolution	1280 x 1024	1280 x 1024
Frame Rate*	170 FPS	170 FPS
Megapixels	1.3 MP	1.3 MP
Chroma	Mono	Color
Sensor	On Semi P1300, CMOS, 1/2"	On Semi P1300, CMOS, 1/2"
Readout Method	Global shutter	Global shutter
Pixel Size	4.8 µm	4.8 µm
Lens Mount	C-mount	C-mount
ADC	10-bit	10-bit
Minimum Frame Rate**	1 FPS	1 FPS
Gain Range**	0 to 18 dB	0 to 18 dB
Exposure Range**	6 us to 30 s	6 us to 30 s
Acquisition Modes	Continuous, Single Frame, Multi Frame	Continuous, Single Frame, Multi Frame
Partial Image Modes	Pixel binning, decimation, ROI	Pixel binning, decimation, ROI
Image Processing	Gamma, lookup table, and sharpness	Color correction matrix, gamma, lookup table, hue, saturation, and sharpness
Sequencer	Up to 8 sets using 6 features, including image size	Up to 8 sets using 6 features, including image size
Image Buffer	240 MB	240 MB
User Sets	2 user configuration sets for custom camera settings	2 user configuration sets for custom camera settings
Flash Memory	6 MB non-volatile memory	6 MB non-volatile memory
Opto-isolated I/O	1 input, 1 output	1 input, 1 output
Non-isolated I/O	1 bi-directional, 1 input	1 bi-directional, 1 input
Auxiliary Output	3.3V, 120 mA maximum	3.3V, 120 mA maximum
Interface	USB 3.0	USB 3.0
Power Requirements	8 - 24 V via GPIO or 5 V via USB 3.0 interface	8 - 24 V via GPIO or 5 V via USB 3.0 interface
Power Consumption	3 W maximum	3 W maximum
Dimensions/Mass	29 mm x 29 mm x 30 mm / 36 g	29 mm x 29 mm x 30 mm / 36 g
Machine Vision Standard	USB3 Vision v1.0	USB3 Vision v1.0
Compliance	CE, FCC, KCC, RoHS, REACH. The ECCN	CE, FCC, KCC, RoHS, REACH. The ECCN for

	BFS-U3-13Y3M	BFS-U3-13Y3C
	for this product is: EAR099.	this product is: EAR099.
MTBF***	6,330,000 hours @20°C, GB environment 1,582,000 hours @20°C, GM environment	6,330,000 hours @20°C, GB environment 1,582,000 hours @20°C, GM environment
Temperature	Operating: 0°C to 50°C Storage: -30°C to 60°C	Operating: 0°C to 50°C Storage: -30°C to 60°C
Humidity	Operating: 20% to 80% (no condensation) Storage: 30% to 95% (no condensation)	Operating: 20% to 80% (no condensation) Storage: 30% to 95% (no condensation)
Warranty	3 years	3 years

*Frame rates are measured with Device Link Throughput Limit of 380 MBps and Acquisition Frame Rate disabled. Values are rounded down to whole numbers.

**Values are the same in binning and no binning modes.

***Ambient temperature; internal camera temperature is not considered.

2.2 BFS-U3-13Y3M Supported Pixel Formats

8-bit	12-bit	16-bit
Mono8	Mono12Packed	Mono16
	Mono12p	

2.3 BFS-U3-13Y3M Frame Rates

Width	Height	8-bit	12-bit	16-bit	ISP	Binning Horizontal	Binning Vertical	Decimation Horizontal	Decimation Vertical	ADC
1280	1024	170	170	124	Off	No binning	No binning	No decimation	No decimation	10-bit
800	600	284	284	284	Off	No binning	No binning	No decimation	No decimation	10-bit
600	800	216	216	216	Off	No binning	No binning	No decimation	No decimation	10-bit
640	480	351	351	351	Off	No binning	No binning	No decimation	No decimation	10-bit

320	256	90	90	90	90	90	On	4x ISP	4x ISP	No decimation	No decimation	10-bit

Frame rates are measured with Device Link Throughput Limit of 380 MBps and Acquisition Frame Rate disabled. Values are rounded to whole numbers.

*ISP Off is only supported with uninterpolated formats (Mono and Bayer). YUV and RGB formats are not supported.

3 Acquisition Control

3.1 Acquisition and Frame Rate

There are three acquisition modes:

Continuous - acquires images continuously. This is the default mode.

Multi Frame - acquires a specified number of images before stopping acquisition.

Single Frame - acquires 1 image before stopping acquisition.

Use [AcquisitionMode](#) to select your mode. If you select MultiFrame, use [AcquisitionFrameCount](#) to specify the number of images to acquire.

Use [AcquisitionStart](#) and [AcquisitionStop](#) to start and stop acquiring images with the selected mode.

The Acquisition Frame Rate can be manually or automatically controlled. Use [AcquisitionFrameRateEnable](#) to set this On (manual control) or Off (automatic control). By default, this is Off. If you select manual control, use [AcquisitionFrameRate](#) to specify a frame rate.

The [ResultingFrameRate](#) reports the actual frame rate at which the camera is streaming. If this does not equal the Acquisition Frame Rate it is because the Exposure Time is greater than the frame time.

3.2 Exposure Time Modes

There are two exposure time modes:

Timed - exposure time is a specified value. This is the default mode.

TriggerWidth - exposure time is controlled by the trigger signal.

Use [ExposureMode](#) to make a selection.

When ExposureMode is set to Timed, exposure time can be manually or automatically controlled.

For manual control, set [ExposureAuto](#) to Off. Use the [ExposureTime](#) control to set the exposure time in microseconds.

For automatic control, set ExposureAuto to Once or Continuous. The camera automatically adjusts the exposure to maximize the dynamic range. Once briefly enables automatic exposure to adapt the device and then sets exposure to manual control (Off). Continuous constantly adapts the device. Continuous is the default setting.

Note: For the [Auto Exposure feature](#), gain and/or exposure time must be set to Continuous.

3.2.1 Trigger Features

Triggering allows you to acquire images at specific times when an event occurs. Triggering works with the acquisition modes and settings. By default, triggering is set to Off. To enable triggering, set [TriggerMode](#) to On.

Trigger Type - three options to control the start of triggering. Use [TriggerSelector](#) to select an option.

Acquisition Start - A trigger starts acquisition in the selected AcquisitionMode.

In Single Frame mode, the trigger acquires one image.

In Multi Frame mode, the trigger acquires the specified number of images.

In Continuous mode, the trigger acquires images until you stop acquisition.

Frame Start - A trigger is required for each individual image that is acquired.

In Single Frame mode, the trigger acquires one image. For each subsequent trigger you first must use AcquisitionStart to receive more images.

In Multi Frame mode, the trigger acquires the specified number of images. For each subsequent trigger you first must use AcquisitionStart to receive more images.

In Continuous mode, the trigger acquires one image. You do not have to start acquisition again for subsequent triggers.

Frame Burst Start - A trigger acquires a specified number of images. You do not have to start acquisition again for subsequent triggers. This mode is primarily used in Continuous mode, as Single Frame and Multi Frame settings overwrite the burst count. Use [AcquisitionBurstFrameCount](#) to specify the number of images to be acquired.

In Single Frame mode, the trigger acquires one image.

In Multi Frame mode, the trigger acquires the number of images specified in AcquisitionFrameCount.

In Continuous mode, the trigger acquires the number of images specified in AcquisitionBurstFrameCount.

Trigger Source - Use [TriggerSource](#) to specify the source that can signal the acquisition to acquire images. A trigger source can be one of the physical Line Inputs, User Outputs, Counters, Logic Blocks, and Software.

Trigger Activation - Use [TriggerActivation](#) to specify what voltage level or transition that activates a trigger. Trigger activation can be Level Low, Level High, Falling Edge, Rising Edge, or Any Edge.

Trigger Overlap - Use [TriggerOverlap](#) to specify whether a trigger responds while the readout of a previously acquired image is still occurring. There are two options: When set to Off, a trigger is disregarded during readout. When set to ReadOut, a trigger acquires another image during readout.

Trigger Delay - Use [TriggerDelay](#) to specify the time in microseconds between when the camera receives a trigger and when exposure begins for the image.

Trigger Software - If your trigger source is set to Software, use [TriggerSoftware](#) to perform a software trigger.

3.3 Summary Table

Name	Interface	Access	Visibility	Description
Acquisition Mode	IEnumeration		Beginner	Sets the acquisition mode of the device. Continuous: acquires images continuously. Multi Frame: acquires a specified number of images before stopping acquisition. Single Frame: acquires 1 image before stopping acquisition.
Acquisition Start	ICommand		Beginner	This command starts the acquisition of images.
Acquisition Stop	ICommand		Beginner	This command stops the acquisition of images.

Name	Interface	Access	Visibility	Description
Acquisition Frame Count	IInteger		Beginner	Number of images to acquire during a multi frame acquisition.
Acquisition Burst Frame Count	IInteger		Beginner	This feature is used only if the FrameBurstStart trigger is enabled and the FrameBurstEnd trigger is disabled. Note that the total number of frames captured is also conditioned by AcquisitionFrameCount if AcquisitionMode is MultiFrame and ignored if AcquisitionMode is Single.
Exposure Mode	IEnumeration	RW	Beginner	Sets the operation mode of the Exposure.
Exposure Time	IFloat		Beginner	Exposure time in microseconds when Exposure Mode is Timed.
Exposure Auto	IEnumeration		Beginner	Sets the automatic exposure mode
Acquisition Frame Rate	IFloat		Beginner	User controlled acquisition frame rate in Hertz
Resulting Frame Rate	IFloat	RO	Beginner	Resulting frame rate in Hertz. If this does not equal the Acquisition Frame Rate it is because the Exposure Time is greater than the frame time.
Acquisition Frame Rate Enable	IBoolean	RW	Beginner	If enabled, AcquisitionFrameRate can be used to manually control the frame rate.
Acquisition Line Rate	IFloat		Beginner	Controls the rate (in Hertz) at which the Lines in a Frame are captured.
Trigger Selector	IEnumeration	RW	Beginner	Selects the type of trigger to configure.
Trigger Mode [Trigger Selector]	IEnumeration	RW	Beginner	Controls whether or not trigger is active.
Trigger Software [Trigger Selector]	ICommand	WO	Beginner	Generates an internal trigger if Trigger Source is set to Software.
Trigger Source [Trigger Selector]	IEnumeration	RW	Beginner	Specifies the internal signal or physical input line to use as the trigger source.

Name	Interface	Access	Visibility	Description
Trigger Activation [Trigger Selector]	IEnumeration	RW	Beginner	Specifies the activation mode of the trigger.
Trigger Overlap [Trigger Selector]	IEnumeration	RW	Beginner	Specifies the overlap mode of the trigger.
Trigger Delay [Trigger Selector]	IFloat		Expert	Specifies the delay in microseconds (μ s) to apply after the trigger reception before activating it.
Sensor Shutter Mode	IEnumeration	RW	Guru	Sets the shutter mode of the device.

3.4 Acquisition Control Features

3.4.1 Acquisition Mode

Sets the acquisition mode of the device. Continuous: acquires images continuously. Multi Frame: acquires a specified number of images before stopping acquisition. Single Frame: acquires 1 image before stopping acquisition.

Property	Value

GlobalReset

4 Analog Control

4.1 Gain

Gain is the amount of amplification that is applied to a pixel by the A/D converter. An increase in gain can result in a brighter image but also an increase in noise.

Gain can be manually or automatically controlled.

Use the [Gain Selector](#) to choose which gain to control. The All selection is a total amplification across all channels (or taps).

For manual control, set [GainAuto](#) to Off. Use the [Gain](#) control to set the amplification in dB.

For automatic control, set [GainAuto](#) to Once or Continuous. The camera automatically adjusts the gain to maximize the dynamic range. Once briefly enables automatic gain to adapt the device and then sets gain back to manual control (Off). Continuous constantly adapts the device.

Note: For the [Auto Exposure feature](#), gain and/or exposure time must be set to Once or Continuous.

4.2 Black Level

The Black Level feature controls the offset applied to the video signal. It determines the image average when there is no light reaching the sensor.

There are two methods of applying black level: **Analog** and **Digital**. The analog black level controls the offset applied during analog-to-digital (A/D) conversion. The digital black level is an offset applied after the image has been digitized.

The sum of the analog and digital black levels can be set and read by setting [Black Level Selector](#) to **All** and then using the [Black Level](#) feature to enter or view the percentage offset.

Only the total black level (All) can be set by the user. Based on the value of black level All, the analog and digital black levels are automatically set to achieve the requested total black level.

4.3 White Balance

White balance compensates for color shifts caused by different lighting conditions. White balance is specified as the gains of the **Red** and **Blue** channels relative to **Green**. For example, if the blue balance ratio is set to 1.5 then 50% more gain is applied to the blue channel than the green channel. White balance can be manually or automatically controlled.

For manual control, set [White Balance Auto](#) to Off. Use the [Balance Ratio Selector](#) to select either the Red or Blue channel. Use the [Balance Ratio](#) to specify a value for that channel. To disable white balance, set both red and blue balance ratios to 1.0.

For automatic control, set [White Balance Auto](#) to Once or Continuous. The camera automatically adjusts the red and blue balance ratios to achieve good color balance. Once runs for a number of iterations and then sets White Balance Auto to Off. Continuous adjusts the values continually if the algorithm determines that the colors are

imbalanced. A number of parameters that affect automatic white balance are available in the [AutoAlgorithmControl](#) category.

The white balance can also be modified by selecting a light source with [RGB Transform Light Source](#). Selecting a light source modifies both the red and blue balance ratio values as well as the active RGBtoRGB [Color Transformation](#), to achieve good color for the specified lighting condition.

4.4 Gamma

The [Gamma](#) feature controls the gamma correction applied to pixel intensity. The equation used is:

$$P' = P^{\text{Gamma}}$$

where P is the input pixel value and P' is the pixel value after gamma correction. Note that the value for Gamma is defined as the power applied to the pixel value, and not the gamma of the display. If a display with a gamma of 2.0 is used, the image gamma can be set to 0.5 to compensate. For sRGB output, Gamma should be set to 0.4545 (1/2.2).

If linear output data is required, disable gamma by setting [GammaEnable](#) to 0.

Gamma and the Pixel [Lookup Table](#) (LUT) can both be used at once. Gamma is applied before the Pixel LUT.

4.5 Sharpening

The sharpening features control how sharp the image looks.

Sharpening can be enabled (On) or disabled (Off). By default sharpening is disabled. Use [Sharpening Enable](#) to switch on or off.

When sharpening is enabled, the remaining sharpening features take effect. When it is disabled, the image is not sharpened.

Sharpening is applied only to an intensity gradient change that is above a specified threshold. This prevents sharpening from amplifying subtle intensity variances in what are otherwise smooth patches, but allows significant edges to be more pronounced.

The threshold is specified as a fraction of the total intensity range, and ranges from 0 to 0.25. A threshold higher than 25% produces little to no difference than 25%. High thresholds sharpen only areas with significant intensity changes. Low thresholds sharpen more areas.

The sharpening threshold can be controlled manually or automatically.

For manual control, set [Sharpening Auto](#) to Off. Then set a [Sharpening Threshold](#) value to indicate the minimum intensity gradient change to invoke sharpening.

For automatic control, set Sharpening Auto to On. With automatic control, the value of the Sharpening Threshold is set based on the noise level of the camera.

Adjust the sharpening amount with the [Sharpening](#) control. This value controls how much to amplify the edges above the Sharpening threshold. A value of 0 does not apply any sharpening. A negative value smooths the image. A positive value amplifies the edges of the image. You can boost by a maximum of 8x, but smoothing is limited to 1x. The default value is 2.0.

4.6 Summary Table

Name	Interface	Access	Visibility	Description
Gain Selector	IEnumeration		Beginner	Selects which gain to control. The All selection is a total amplification across all channels (or taps).
Gain [Gain Selector]	IFloat		Beginner	Controls the amplification of the video signal in dB.
Gain Auto	IEnumeration		Beginner	Sets the automatic gain mode. Set to Off for manual control. Set to Once for a single automatic adjustment then return to Off. Set to Continuous for constant adjustment. In automatic modes, the camera adjusts the gain to maximize the dynamic range.
Black Level Selector	IEnumeration		Beginner	Selects which black level to control. Only All can be set by the user. Analog and Digital are read-only.
Black Level Raw [Black Level Selector]	IInteger		Expert	Controls the offset of the video signal in camera specific units.
Black Level [Black Level Selector]	IFloat		Beginner	Controls the offset of the video signal in percent.
Black Level Clamping Enable	IBoolean	RW	Guru	Enable the black level auto clamping feature which performing dark current compensation.
Balance Ratio Selector	IEnumeration		Expert	Selects a balance ratio to configure once a balance ratio control has been selected.
Balance Ratio [Balance Ratio Selector]	IFloat		Expert	Controls the balance ratio of the selected color relative to green. Used for white balancing.
Balance White Auto	IEnumeration	RW	Expert	White Balance compensates for color shifts caused by different lighting conditions. It can be automatically or manually controlled. For manual control, set to Off. For automatic control, set to Once or Continuous.

Name	Interface	Access	Visibility	Description
Gamma	IFloat		Beginner	Controls the gamma correction of pixel intensity.
Gamma Enable	IBoolean		Beginner	Enables/disables gamma correction.
Sharpening Enable	IBoolean	RW	Beginner	Enables/disables the sharpening feature. Sharpening is disabled by default.
Sharpening Auto	IBoolean	RW	Beginner	Enables/disables the auto sharpening feature. When enabled, the camera automatically determines the sharpening threshold based on the noise level of the camera.
Sharpening	IFloat	RW	Beginner	Controls the amount to sharpen a signal. The sharpened amount is proportional to the difference between a pixel and its neighbors. A negative value smooths out the difference, while a positive value amplifies the difference. You can boost by a maximum of 8x, but smoothing is limited to 1x (in float). Default value: 2.0
Sharpening Threshold	IFloat	RW	Guru	Controls the minimum intensity gradient change to invoke sharpening. When "Sharpening Auto" is enabled, this is determined automatically by the device. The threshold is specified as a fraction of the total intensity range, and ranges from 0 to 0.25. A threshold higher than 25% produces little to no difference than 25%. High thresholds sharpen only areas with significant intensity changes. Low thresholds sharpen more areas.

4.7 Analog Control Features

4.7.1 Gain Selector

Selects which gain to control. The All selection is a total amplification across all channels (or taps).

Visibility	Beginner

4.7.12 Gamma Enable

Enables/disables gamma correction.

Property	Value
Name	GammaEnable
Interface	IBoolean
Access	

Property	Value
Visibility	Beginner

4.7.13 Sharpening Enable

Enables/disables the sharpening feature. Sharpening is disabled by default.

Property	Value
Name	SharpeningEnable
Interface	IBoolean
Access	RW
Visibility	Beginner

4.7.14 Sharpening Auto

Enables/disables the auto sharpening feature. When enabled, the camera automatically determines the sharpening threshold based on the noise level of the camera.

Property	Value
Name	SharpeningAuto
Interface	IBoolean
Access	RW
Visibility	Beginner

4.7.15 Sharpening

Controls the amount to sharpen a signal. The sharpened amount is proportional to the difference between a pixel and its neighbors. A negative value smooths out the difference, while a positive value amplifies the difference. You can boost by a maximum of 8x, but smoothing is limited to 1x (in float). Default value: 2.0

Property	Value
Name	Sharpening
Interface	IFloat
Access	RW
Unit	
Visibility	Beginner

4.7.16 Sharpening Threshold

Controls the minimum intensity gradient change to invoke sharpening. When "Sharpening Auto" is enabled, this is determined automatically by the device. The threshold is specified as a fraction of the total intensity range, and ranges from 0 to 0.25. A threshold higher than 25% produces little to no difference than 25%. High thresholds sharpen only areas with significant intensity changes. Low thresholds sharpen more areas.

Property	Value
Name	SharpeningThreshold
Interface	IFloat
Access	RW
Unit	
Visibility	Guru

5 Image Format Control

5.1 Binning/Decimation

Binning refers to the act of combining the signal from groups of photo-sensitive cells into a larger logical pixel. This is achieved by either adding (additive), averaging (average), or discarding (discard). Binning may be implemented in analog by the sensor or digitally by the Image Signal Processing engine (ISP).

Note: Binning and Decimation cannot operate simultaneously. For one to be active, the other must be inactive. Changes to binning features can only be made while the camera is not streaming.

Use the [BinningSelector](#) to choose the binning engine. This affects both horizontal and vertical binning. The choices are:

All - the total amount of binning. In this mode, the camera adjusts the sensor/ISP binning to achieve the best image quality with the fastest frame rate.

Sensor - the portion of binning implemented in analog by the sensor. Binning done by the sensor usually results in a higher frame rate. Unless otherwise specified, or unsupported, binning is done by the sensor by default.

ISP - the portion of binning implemented digitally by the ISP. Unless otherwise specified, binning is done by the ISP if sensor binning is unsupported or compromises image quality.

Use [BinningHorizontalMode](#) and [BinningVerticalMode](#) to choose the algorithm to perform the combination. The choices are:

Additive - The response from the combined cells are added, resulting in increased sensitivity (a brighter image).

Average - The response from the combined cells are averaged, resulting in increased signal to noise ratio. Some sensors do not support average binning.

Use [BinningHorizontal](#) and [BinningVertical](#) to set the number of cells to combine. Binning values reduce the resolution of the image by a corresponding factor. A value of 1 indicates no binning. This must be set to 1 for decimation to be active.

Use [DecimationSelector](#) to choose the decimation engine. The choices are **All** or **Sensor**. Decimation cannot be done by the ISP.

[DecimationHorizontalMode](#) and [DecimationVerticalMode](#) indicate the algorithm to perform the reduction. There is only one decimation mode supported: **Discard**.

Use [DecimationHorizontal](#) and [DecimationVertical](#) to set the number of cells to discard. This value reduces the resolution of the image by only retaining a single pixel within a window whose size is the specified decimation factor. A value of 1 indicates no decimation. This must be set to 1 for binning to be active.

5.1.1 Binning/Decimation Feature Dependency

There are many feature dependencies which can affect binning. You can disable the ISP engine which would force all binning to be sensor controlled. However, some pixel formats (such as YUV and RGB) do not allow the ISP to be disabled, as it is required for color interpolation. In addition, not all sensors support average binning.

A simple hierarchical organization of the features means that features higher up have the greatest flexibility. Choices made at the top of the hierarchy adjust features downstream. The camera always attempts to achieve the best possible image quality.

5.2 Pixel Format

Format of the pixel provided by the camera. Use [PixelFormat](#) feature to select from a list of supported formats. (Not all formats are supported on all cameras.) Once a format is selected, the following values are derived:

[PixelSize](#) provides the total size in bits of the image's pixel.

[PixelColorFilter](#) is the type of color filter that is applied to the image. This only applies to bayer formats. The value is None for other formats.

[PixelDynamicRangeMin](#) is the minimum value that can be returned during the digitization process. This corresponds to the darkest value of the camera. For color cameras, this returns the smallest value that each color component can take.

[PixelDynamicRangeMax](#) is the maximum value that can be returned during the digitization process. This corresponds to the brightest value of the camera. For color cameras, this returns the largest value that each color component can take.

Note: For color cameras, the bayer pixel format is updated if [Reverse X](#) and [Reverse Y](#) are changed. For example, if the original pixel format is BayerRG8 and [Reverse X](#) is switched from Disabled to Enabled, then the pixel format is updated to BayerGR8.

5.2.1 Single Channel 8-bit and 16-bit Formats

8-bit Formats	Mono8	8-bit monochrome packed format
	BayerGR8	8-bit bayer green red packed format
	BayerRG8	8-bit bayer red green packed format
	BayerGB8	8-bit bayer green blue packed format
	BayerBG8	8-bit bayer blue green packed format
16-bit Formats	Mono16	16-bit monochrome packed format
	BayerGR16	16-bit bayer green red packed format
	BayerRG16	16-bit bayer red green packed format
	BayerGB16	16-bit bayer green blue packed format
	BayerBG16	16-bit bayer blue green packed format

5.2.2 Single Channel 12-bit Formats

12-bit pixel formats have two different packing formats as defined by USB3 Vision and GigE Vision. **Note:** the packing format is not related to the interface of the camera. Both may be available on USB3 or GigE devices.

The USB3 Vision method is designated with a p. It is a 12-bit format with its bit-stream following the bit packing method illustrated in Figure 1. The first byte of the packed stream contains the eight least significant bits (lsb) of

the first pixel. The third byte contains the eight most significant bits (msb) of the second pixel. The four lsb of the second byte contains four msb of the first pixel, and the rest of the second byte is packed with the four lsb of the second pixel.

This packing format is applied to: Mono12p, BayerGR12p, BayerRG12p, BayerGB12p and BayerBG12p.

Figure 1. Packing two 12-bit pixels into three bytes.

The GigE Vision method is designated with Packed. It is a 12-bit format with its bit-stream following the bit packing method illustrated in Figure 2. The first byte of the packed stream contains the eight msb of the first pixel. The third byte contains the eight msb of the second pixel. The four lsb of the second byte contains four lsb of the first pixel, and the rest of the second byte is packed with the four lsb of the second pixel.

This packing format is applied to: Mono12Packed, BayerGR12Packed, BayerRG12Packed, BayerGB12Packed and BayerBG12Packed.

Figure 2. Packing two 12-bit pixels into three bytes.

5.2.3 Multi-Channel Formats

For the following pixel formats, the color channels are packed in the order indicated:

- RGB8Packed 8-bit red-green-blue packed format
- BGR8 8-bit blue-green-red packed format
- BGRa8 8-bit blue-green-red-alpha packed format

For YCbCr and YUV pixel formats, the RGB to YCbCr transformation follows Equation 1 below:

$$\begin{aligned}
 Y' &= 0.299 R' + 0.587 G' + 0.114 B' \\
 Cb &= -0.16874 R' - 0.33126 G' + 0.5000 B' + 128 \\
 Cr &= 0.5000 R' - 0.41869 G' - 0.08131 B' + 128
 \end{aligned}$$

5.2.3.1 YCbCr8 / YUV444Packed

8-bit Y-Cb-Cr 4:4:4 format (Figure 3). No sub-sampling on Y, Cb or Cr. The values of Y, Cb and Cr cover the full range from 0 to 255 if the input R, G and B values are in the range of [0, 255].

Y ₀₁	Y ₀₂	Y ₀₃	Y ₀₄	Y ₀₅	Y ₀₆	Y ₀₇	U ₀₀	U ₀₁	U ₀₂	U ₀₃	U ₀₄	U ₀₅	U ₀₆	U ₀₇	V ₀₀	V ₀₁	V ₀₂	V ₀₃	V ₀₄	V ₀₅	V ₀₆	V ₀₇

Figure 12. Packing format for **YUV411Packed**.

5.3 ADC Bit Depth

All camera sensors incorporate an analog to digital converter (ADC) to digitize the images.

The camera's ADC is configured to a fixed bit output. This is not the same as pixel size. If the pixel format selected has fewer bits per pixel than the ADC output, the least significant bits are dropped. If the pixel format selected has greater bits per pixel than the ADC output, the least significant bits are padded and can be discarded by the user. Image data is left-aligned across a 2-byte format.

For example, for a 12-bit output, the least significant 4 bits are padded in order to fill 2 bytes (0xFFF0).

A 10-bit conversion produces 1,024 possible values between 0 and 65,472.

A 12-bit conversion produces 4,096 possible values between 0 and 65,520.

A 14-bit conversion produces 16,384 possible values between 0 and 65,532.

Some image sensors support multiple ADC bit depths. A higher ADC bit depth results in better image quality but slower maximum frame rate. Stop acquisition then use the [ADC Bit Depth](#) control to make a selection.

5.4 Test Pattern

The camera is capable of outputting continuous static images for testing and development purposes.

Use the [TestPatternGeneratorSelector](#) feature to choose which test pattern to control.

Sensor produces a test pattern that varies based on the image sensor.

Pipeline Start inserts a test pattern at the start of the camera's image processing pipeline.

Set the [TestPattern](#) feature to Off to disable the selected test pattern generator.

When Sensor is selected, create a test pattern by setting the [TestPattern](#) feature to Sensor Test Pattern.

When Pipeline Start is selected, create a test pattern by setting the [TestPattern](#) feature to Increment. The Increment test pattern increases the pixel value by one 8-bit greyscale value at each pixel location, wrapping around to zero after it reaches 255.

Both test pattern generators can be enabled at the same time, however, the Pipeline Start test pattern overwrites the Sensor test pattern.

Most image processing features (such as [Gamma](#), [Balance Ratio](#), and others) are still available when the test pattern is on and can alter the test pattern image. Some features for controlling the sensor do not affect the test pattern image, such as [Exposure Time](#), [Gain](#), and analog [Black Level](#). It is recommended to turn [Exposure Auto](#) and [Gain Auto](#) Off when using a test pattern, as those features do not function properly when the test pattern is on.

Note that the test pattern generators must be set to Off to get the actual image data from the sensor.

5.5 Region Of Interest

An image region of interest (ROI) lets you specify a portion of the image so that after each image is acquired only the pixel information from the specified portion is processed.

Use the following features to specify the location and size of the ROI. All values are in pixels.

[OffsetX](#) - Horizontal offset from the origin to the ROI.

[Width](#) - Width of the image provided by the device. This reflects the current ROI. The maximum value of this feature takes into account horizontal binning, decimation, or any other function changing the maximum horizontal dimensions of the image and is typically equal to [WidthMax](#) minus OffsetX.

[OffsetY](#) - Vertical offset from the origin to the ROI.

[Height](#) - Height of the image provided by the device. This reflects the current ROI. The maximum value of this feature takes into account vertical binning, decimation, or any other function changing the maximum vertical dimensions of the image and is typically equal to [HeightMax](#) minus OffsetY.

5.6 Reverse X

When Reverse X is enabled, it horizontally flips the image sent by the camera. The region of interest is applied after flipping.

For color cameras, the bayer pixel format may be changed after flipping. For example, BayerRG16 is changed to BayerGR16.

5.7 Reverse Y

When Reverse Y is enabled, it vertically flips the image sent by the camera. The region of interest is applied after flipping.

For color cameras, the bayer pixel format may be changed after flipping. For example, BayerRG16 is changed to BayerGB16.

5.8 Summary Table

Name	Interface	Access	Visibility	Description
Sensor Width	Integer	RO	Expert	Effective width of the sensor in pixels.
Sensor Height	Integer	RO	Expert	Effective height of the sensor in pixels.
Width Max	Integer		Expert	Maximum width of the image (in pixels). The dimension is calculated after horizontal binning. WidthMax does not take into account the current Region of interest (Width or OffsetX).
Height Max	Integer		Expert	Maximum height of the image (in pixels). This dimension is calculated after vertical binning. HeightMax does not take into account the current Region of interest (Height or OffsetY).
Width	Integer		Beginner	Width of the image provided by the device (in pixels).
Height	Integer		Beginner	Height of the image provided by the device (in pixels).
Offset X	Integer		Beginner	Horizontal offset from the origin to the ROI (in pixels).
Offset Y	Integer		Beginner	Vertical offset from the origin to the ROI (in pixels).
Pixel Format	Enumeration		Beginner	Format of the pixel provided by the camera.
Pixel Size	Enumeration	RO	Expert	Total size in bits of a pixel of the image.

Name	Interface	Access	Visibility	Description
Pixel Color Filter	IEnumeration	RO	Expert	Type of color filter that is applied to the image. Only applies to Bayer pixel formats. All others have no color filter.
Pixel Dynamic Range Min	IInteger	RO	Expert	Minimum value that can be returned during the digitization process. This corresponds to the darkest value of the camera. For color cameras, this returns the smallest value that each color component can take.
Pixel Dynamic Range Max	IInteger	RO	Expert	Maximum value that can be returned during the digitization process. This corresponds to the brightest value of the camera. For color cameras, this returns the biggest value that each color component can take.
ISP Enable	IBoolean	RW	Expert	Controls whether the image processing core is used for optional pixel format mode (i.e. mono).
Binning Selector	IEnumeration		Beginner	Selects which binning engine is controlled by the BinningHorizontal and BinningVertical features.
Binning Horizontal Mode [Binning Selector]	IEnumeration		Expert	
Binning Vertical Mode [Binning Selector]	IEnumeration		Expert	
Binning Horizontal [Binning Selector]	IInteger		Beginner	Number of horizontal photo-sensitive cells to combine together. This reduces the horizontal resolution (width) of the image. A value of 1 indicates that no horizontal binning is performed by the camera. This value must be 1 for decimation to be active.
Binning Vertical [Binning Selector]	IInteger		Beginner	Number of vertical photo-sensitive cells to combine together. This reduces the vertical resolution (height) of the image. A value of 1 indicates that no vertical binning is performed by the camera. This value must be 1 for decimation to be active.
Decimation Selector	IEnumeration		Beginner	Selects which decimation layer is controlled by the DecimationHorizontal and DecimationVertical features.
Decimation Horizontal Mode [Decimation Selector]	IEnumeration		Expert	The mode used to reduce the horizontal resolution when DecimationHorizontal is used. The current implementation only supports a single decimation mode: Discard. Average should be achieved via Binning.

Name	Interface	Access	Visibility	Description
Selector]				
Decimation Vertical Mode [Decimation Selector]	IEnumeration		Expert	The mode used to reduce the vertical resolution when DecimationVertical is used. The current implementation only supports a single decimation mode: Discard. Average should be achieved via Binning.
Decimation Horizontal [Decimation Selector]	IInteger		Beginner	Horizontal decimation of the image. This reduces the horizontal resolution (width) of the image by only retaining a single pixel within a window whose size is the decimation factor specified here. A value of 1 indicates that no horizontal decimation is performed by the camera. This value must be 1 for binning to be active.
Decimation Vertical [Decimation Selector]	IInteger		Beginner	Vertical decimation of the image. This reduces the vertical resolution (height) of the image by only retaining a single pixel within a window whose size is the decimation factor specified here. A value of 1 indicates that no vertical decimation is performed by the camera. This value must be 1 for binning to be active.
Reverse X	IBoolean	RW	Expert	Horizontally flips the image sent by the device. The region of interest is applied after flipping. For color cameras the bayer pixel format is affected. For example, BayerRG16 changes to BayerGR16.
Reverse Y	IBoolean	RW	Expert	Vertically flips the image sent by the device. The region of interest is applied after flipping. For color cameras the bayer pixel format is affected. For example, BayerRG16 changes to BayerGB16.
Test Pattern Generator [Test Pattern Selector]	IEnumeration			Selects which test pattern generator is controlled by the TestPattern feature.
Test Pattern [Test Pattern Generator Selector]	IEnumeration			Selects the type of test pattern that is generated by the device as image source.
ADC Bit Depth	IEnumeration		Beginner	Selects which ADC bit depth to use. A higher ADC bit depth results in better image quality but slower maximum frame rate.

5.9 Image Format Control Features

5.9.1 Sensor Width

Effective width of the sensor in pixels.

Property	Value
Name	SensorWidth
Interface	Integer
Access	RO
Unit	
Visibility	Expert
Value	1280

5.9.2 Sensor Height

Effective height of the sensor in pixels.

Property	Value
Name	SensorHeight
Interface	Integer
Access	RO
Unit	
Visibility	Expert
Value	1024

5.9.3 Width Max

Maximum width of the image (in pixels). The dimension is calculated after horizontal binning. WidthMax does not take into account the current Region of interest (Width or OffsetX).

Property	Value
Name	WidthMax
Interface	Integer
Access	
Unit	
Visibility	Expert

5.9.4 Height Max

Maximum height of the image (in pixels). This dimension is calculated after vertical binning. HeightMax does not take into account the current Region of interest (Height or OffsetY).

Property	Value
Name	HeightMax
Interface	Integer
Access	
Unit	
Visibility	Expert

5.9.5 Width

Visibility	Beginner

5.9.25 Reverse X

Horizontally flips the image sent by the device. The region of interest is applied after flipping. For color cameras the bayer pixel format is affected. For example, BayerRG16 changes to BayerGR16.

Property	Value
Name	ReverseX
Interface	IBoolean
Access	RW
Visibility	Expert

5.9.26 Reverse Y

Vertically flips the image sent by the device. The region of interest is applied after flipping. For color cameras the bayer pixel format is affected. For example, BayerRG16 changes to BayerGB16.

Property	Value
Name	ReverseY
Interface	IBoolean
Access	RW

Property	Value
Visibility	Expert

5.9.27 Test Pattern Generator Selector

Selects which test pattern generator is controlled by the TestPattern feature.

Property	Value
Name	TestPatternGeneratorSelector
Interface	IEnumeration
Access	
Visibility	

Enumeration Values

Sensor

PipelineStart

5.9.28 Test Pattern

Selects the type of test pattern that is generated by the device as image source.

Property	Value
Name	TestPattern [Test Pattern Generator Selector]
Interface	IEnumeration
Access	
Visibility	

Enumeration Values

Off

Increment

SensorTestPattern

5.9.29 ADC Bit Depth

Selects which ADC bit depth to use. A higher ADC bit depth results in better image quality but slower maximum frame rate.

Property	Value
Name	AdcBitDepth
Interface	IEnumeration
Access	
Visibility	Beginner

Enumeration Values

Bit8
Bit10
Bit12
Bit14

6 Device Control

Device Control provides you with device information and allows you to control some device parameters.

6.1 General Information

Use [Device User ID](#) to enter a unique device name. This information is retained over power cycles.

Use [Device Indicator Mode](#) to control the status LED. The LED can be active, inactive, or in error mode.

6.2 Bandwidth

Information about the bandwidth usage and link speed is provided.

Use [Device Link Throughput Limit](#) to specify what bandwidth is used for the streaming of data. This affects the maximum frame rate. This must be less than the Device Max Throughput.

6.3 Timestamp

Use [Timestamp Latch](#) to capture the current timestamp of the device.

6.4 Power Supply

Use the [Device Power Supply Selector](#) to choose a power supply, either External or Sensor (Internal). External power is either through the device interface or through GPIO.

6.5 Device Reset

Use [Device Reset](#) to soft reboot the camera. Use [Factory Reset](#) to clear any user tables loaded and perform a soft reboot of the camera.

6.6 Summary Table

Name	Interface	Access	Visibility	Description
Device Scan Type	IEnumeration	RO	Expert	Scan type of the sensor of the device.
Device Vendor Name	IStringReg		Beginner	Name of the manufacturer of the device.
Device Model Name	IStringReg		Beginner	Model name of the device.
Sensor Description	IStringReg		Guru	Returns Sensor Description

Name	Interface	Access	Visibility	Description
Device Firmware Version	IStringReg		Beginner	Firmware version of the device.
Device Serial Number	IStringReg		Expert	Device serial number. This string is a unique identifier of the device.
Device User ID	IStringReg		Beginner	User Defined Name. This can be used to enter a unique device name. This information is retained over power cycles.
Device TL Type	IEnumeration	RO	Beginner	Transport Layer type of the device.
Device Gen CP Version Major	Integer	RO	Beginner	Major version of the GenCP protocol supported by the device.
Device Gen CP Version Minor	Integer	RO	Beginner	Minor version of the GenCP protocol supported by the device.
Device Max Throughput	Integer	RO	Expert	Maximum bandwidth of the data that can be streamed out of the device. This can be used to estimate if the physical connection(s) can sustain transfer of free-running images from the camera at its maximum speed.
Device Link Speed	Integer	RO	Guru	Link Speed
Device Link Throughput Limit	Integer	RW	Expert	Limits the maximum bandwidth of the data that will be streamed out by the device on the selected Link. If necessary, delays will be uniformly inserted between transport layer packets in order to control the peak bandwidth.
Device Link Bandwidth Reserve	Float	RW	Expert	Percentage of streamed data bandwidth reserved for packet resend.
Device Link Current Throughput	Integer	RO	Expert	Current bandwidth of streamed data.
Device Reset	ICommand	WO	Guru	This is a command that immediately resets and reboots the device.
Device Indicator Mode	IEnumeration		Expert	Controls the LED behaviour: Inactive (off), Active (current status), or Error Status (off unless an error occurs).
Device Temperature	Float	RO	Expert	Device temperature in degrees Celsius (C).
Timestamp	Integer	RO	Expert	Reports the current value of the device timestamp counter (ns).

Name	Interface	Access	Visibility	Description
Timestamp Latch	ICommand	WO	Expert	Latches the current device time into the timestamp register.
Timestamp Increment	Integer	RO	Expert	Indicates the timestamp increment in ns/tick.
Device Power Supply Selector	IEnumeration		Expert	Selects the power supply source to control or read.
Power Supply Voltage [Device Power Supply Selector]	IFloat	RO	Expert	Indicates the current voltage of the selected power supply (V).
Power Supply Current [Device Power Supply Selector]	IFloat	RO	Expert	Indicates the output current of the selected power supply (A).
Device Uptime	Integer	RO	Expert	Total time since the device was powered up in seconds.
Link Uptime	Integer	RO	Expert	Time since the last phy negotiation (enumeration).
Enumeration Count	Integer	RO	Expert	Number of enumerations since uptime.
Factory Reset	ICommand	WO	Guru	Returns all user tables to factory default
Max Device Reset Time	Integer	RO	Expert	Time to wait until device reset complete (ms).

7 Transport Layer Control

The Transport Layer control provides the following information:

Payload Size - the number of bytes transferred for each image (including chunk data).

USB3 Vision Tab - Message Channel - Channel ID used for the Message Channel.

U3v Version Major/Minor - USB3 Vision standard version.

U3V Capabilities - what the camera supports (SIRM, EIRM and IIDC2).

Max Command Transfer Length - the maximum supported commands that can be sent to the camera.

Max Ack Transfer Length - the maximum supported ack that can be sent to the camera.

Number of Stream Channels - the number of stream channels the camera supports.

Current Speed - the speed of the camera's interface (Super Speed, High Speed).

Link Error Count - the number of errors on the usb link.

Link Recovery Count - the number of times the USB link has recovered.

7.1 Summary Table

Name	Interface	Access	Visibility	Description
Payload Size	Integer		Expert	Provides the number of bytes transferred for each image or chunk on the stream channel.
USB3 Vision	Category	RO	Beginner	Category that contains the features pertaining to the USB3 Vision transport layer of the device.
Link Error Count	Integer	RO	Expert	Counts the number of error on the link.
Link Recovery Count	Integer	RO	Expert	Counts the number of times the USB link has recovered.

7.2 Transport Layer Control Features

7.2.1 Payload Size

Provides the number of bytes transferred for each image or chunk on the stream channel.

Property **Value**

Name	PayloadSize

7.3.2.11 Current Speed

Specifies the current speed of the USB link.

Property	Value
Name	U3VCurrentSpeed
Interface	IEnumeration
Access	RO
Visibility	Expert

Enumeration Values

LowSpeed
FullSpeed
HighSpeed
SuperSpeed

8 Sequencer Control

The purpose of a sequencer is to allow you to programmatically control the acquisition parameters of an image sequence. You can define not only how the images are captured (i.e. the camera feature settings) but also when the camera transitions from one acquisition setting to another. This is akin to a state machine diagram where the states correspond to the sequencer set feature settings, and the transition among states corresponds to a particular event that triggers the state machine to move from one state to another.

The features to configure and deploy the sequencer are grouped under the Sequencer Control category.

8.1 Sequenced Feature Settings

The feature settings used in a sequence set are a combination of the features specifically configured for the set and what was active when the set was saved. Because many of the camera features are dependently linked to each other, settings may be saved to a set that are outside of the sequencer configuration.

Sequencer features can be classified as follows:

Direct - direct features are those you define as being part of the set with specified values which may vary from one set to another and are independently recorded for each set. Examples include: exposure time, gain, resolution, and offset.

Implied - implied features are those that are dependent on the direct features. Their settings are recorded for each set. While you do not define their values as part of the set, they are included so that their values are valid. They can be modified during the configuration of a set, but are locked during sequencer operation.

Fixed - fixed features are those that are the preconditions to implied or direct features. These settings are recorded to guarantee the sequenced features are valid. Fixed features have a single value for the entire sequence. This is locked during sequencer configuration and operation.

Forced - forced features are those whose settings are predefined. These are automatic features that if enabled would control other features and invalidate the settings. They are forced into the Off (manual) mode during sequencer operation. During sequencer configuration, they are modifiable, to allow you to achieve the desired conditions which can then be recorded for later operation.

Non-sequenced - non-sequenced are features that are not controlled or affected by the sequencer.

The following diagram provides an example of a web of features and how they are classified based on the fact that a single feature B has been directly sequenced:

Here is an explanation of how the types of various features are resolved:

- **Direct** - Feature B is the only feature you have requested to be sequenced, making it the sole directly sequenced feature.
- **Implied** - The operational range of feature C is directly affected by feature B, hence it must be sequenced but it is implied only.
- **Fixed** - Feature A controls the operational range of feature B, so it must be fixed to guarantee that the recorded feature B value is legal. Feature C depends on feature H, so it must be fixed. Feature H in turn depends on feature G, so it too must be fixed.
- **Non-sequenced** - Features D, E, and I are not included in the sequence.

8.1.1 Sequencer Configuration

The configuration of a sequencer can be broken down into a number of distinct steps :

1. Enable the direct features.

Use the [SequencerFeatureSelector](#) to select which features to directly sequence and set [SequencerFeatureEnable](#) to enabled.

Enabling the direct features must be done prior to entering configuration mode as it determines those features that are defined, implied, fixed, and forced. The enabled features are active for all sequencer sets.

2. Enter configuration mode.

Set [SequencerConfigurationMode](#) to On.

When you enter configuration mode, the camera determines those features which are implied and fixed and locks the fixed features from being modified. If any fixed features need to be adjusted, exit configuration mode by setting [SequencerConfigurationMode](#) to Off. Make the necessary modifications and enter configuration mode again.

3. Configure the features for each sequencer set.

Use [SequencerSetSelector](#) to choose the set to configure. Adjust the features as needed to achieve the desired image. Use the [SequencerSetSave](#) command to save the settings to the selected sequencer set.

Once a set is saved, the camera checks that all the settings are valid. [SequencerSetValid](#) displays the results of this check. If the sequencer set is not valid, adjust the settings and save the set again.

Note: other previously saved and valid sets may become invalid when a set is saved with a new configuration.

Up to 8 sets can be configured and saved.

Once a sequencer set has been configured and is valid, it can be loaded to the active camera at anytime, just like a [User Set](#). The difference between a User Set and a Sequencer Set is the range of features affected. You can load a sequencer set via [SequencerSetLoad](#) at anytime, not just in configuration mode.

Loading is particularly useful when trying to configure multiple sets which may share a similar setup with only minor differences. In that case, you can load an already configured set, select a different set, modify features that are different, and save.

4. Configure the transition between sets.

You must define paths for the sequencer to transition from one set to another. Use [SequencerSetSelector](#) to select the set. Then use [SequencerPathSelector](#) to select the path. The current implementation only support a single path for each set.

This path defines the event that causes the transition and the next set to which that it transitions. Use [SequencerTriggerSource](#) to specify the internal signal or physical input line to use as the trigger source. Use [SequencerTriggerActivation](#) to specify the activation mode of the selected trigger source.

Use [SequencerSetNext](#) to specify which set follows the transition.

Note: The order of steps 3 and 4 is not important, as long as the correct set has been chosen via the [SequencerSetSelector](#).

5. Configure the starting set.

Use [SequencerSetStart](#) to define which set begins the sequencer operation when it is executed.

6. Exit configuration mode.

Set [SequencerConfigurationMode](#) to Off.

Once you have exited configuration mode, the camera checks that the sequencer configuration is valid. [SequencerConfigurationValid](#) displays the results of this check. If the configuration is not valid, enter configuration mode to adjust the settings.

8.1.2 Sequencer Execution

Note: Before you can execute a sequencer session, your sequencer configuration must be valid and your camera must not be streaming.

Set [SequencerMode](#) to On. This locks all sequenced features (direct, implied, fixed, and forced) and loads the starting set.

Start image acquisition. The sequencer transitions from set to set according to your path definitions. [SequencerSetActive](#) displays the current set.

During sequencer execution, all sequenced features (direct, implied, fixed, and forced) are locked as their values are driven by the sequencer. However, you can change any features that are not locked. They behave as per normal operation.

To end the sequencer session, set [SequencerMode](#) to Off. The camera is left in the same state as defined by the last sequencer set.

8.1.3 Sequencer Usage Example - Simple features change while acquiring images

In this example, Set 0 and Set 1 are the main sets for the camera to capture images. The directly sequenced features are **Exposure Time, Gain, Width**. Set 0 is defined to acquire full width images with a long exposure and no gain. Set 1 is defined to acquire half-width images with a shorter exposure and higher gain. The transition between the two sets is defined to be triggered by **RisingEdge** of **FrameStart**, meaning that the sequencer should toggle between the two sets grabbing an image based on the feature contents of the corresponding set configuration each time.

Set 0:

- ExposureTime = 4000
- Gain = 1.0
- Width = 1024
- SequencerSetTriggerSource[0] = FrameStart
- SequencerSetTriggerActivation[0] = RisingEdge
- SequencerSetTriggerSource[0] = FrameStart
- SequencerSetNext[0] = 1

Set 1:

- ExposureTime = 2000
- Gain = 2.0
- Width = 512
- SequencerSetTriggerSource[0] = FrameStart
- SequencerSetTriggerActivation[0] = RisingEdge
- SequencerSetTriggerSource[0] = FrameStart
- SequencerSetNext[0] = 0

Sequencer begins execution from Set 0.

The working diagram is shown in the following figure:

8.2 Summary Table

Name	Interface	Access	Visibility	Description
Sequencer Mode	IEnumeration	RW	Expert	Controls whether or not a sequencer is active.
Sequencer Configuration Mode	IEnumeration	RW	Expert	Controls whether or not a sequencer is in configuration mode.
Sequencer Configuration Valid	IEnumeration	RO	Expert	Display whether the current sequencer configuration is valid to run.
Sequencer Feature Selector	IEnumeration	RW	Expert	Selects which sequencer features to control.
Sequencer Feature Enable [Sequencer Feature Selector]	IBoolean	RW	Expert	Enables the selected feature and makes it active in all sequencer sets.

Name	Interface	Access	Visibility	Description
Sequencer Set Start	IInteger	RW	Expert	Sets the first sequencer set to be used.
Sequencer Set Active	IInteger	RO	Expert	Displays the currently active sequencer set.
Sequencer Set Selector	IInteger	RW	Expert	Selects the sequencer set to which subsequent settings apply.
Sequencer Set Valid [Sequencer Set Selector]	IEnumeration	RO	Expert	Display whether the currently selected sequencer set's register contents are valid to use.
Sequencer Set Save [Sequencer Set Selector]	ICommand	RW	Expert	Saves the current device configuration to the currently selected sequencer set.
Sequencer Set Load [Sequencer Set Selector]	ICommand	RW	Expert	Loads currently selected sequencer to the current device configuration.
Sequencer Path Selector [Sequencer Set Selector]	IInteger	RW	Expert	Selects branching path to be used for subsequent settings.
Sequencer Trigger Source [Sequencer Set Selector] [Sequencer Path Selector]	IEnumeration	RW	Expert	Specifies the internal signal or physical input line to use as the sequencer trigger source.
Sequencer Trigger Activation [Sequencer Set Selector] [Sequencer Path Selector]	IEnumeration	RW	Expert	Specifies the activation mode of the sequencer trigger.
Sequencer Set Next [Sequencer Set Selector] [Sequencer Path Selector]	IInteger	RW	Expert	Specifies the next sequencer set.

8.3 Sequencer Control Features

8.3.1 Sequencer Mode

Controls whether or not a sequencer is active.

8.3.9 Sequencer Set Valid

Display whether the currently selected sequencer set's register contents are valid to use.

Property	Value
Name	SequencerSetValid [Sequencer Set Selector]
Interface	IEnumeration
Access	RO
Visibility	Expert

Enumeration Values

No
Yes

8.3.10 Sequencer Set Save

Saves the current device configuration to the currently selected sequencer set.

Property	Value
Name	SequencerSetSave [Sequencer Set Selector]
Interface	ICommand
Access	RW
Visibility	Expert

8.3.11 Sequencer Set Load

Loads currently selected sequencer to the current device configuration.

Property	Value
Name	SequencerSetLoad [Sequencer Set Selector]
Interface	ICommand
Access	RW
Visibility	Expert

8.3.12 Sequencer Path Selector

Selects branching path to be used for subsequent settings.

Property	Value
Name	SequencerPathSelector [Sequencer Set Selector]
Interface	IInteger
Access	RW
Unit	
Visibility	Expert

8.3.13 Sequencer Trigger Source

Specifies the internal signal or physical input line to use as the sequencer trigger source.

Property	Value
Name	SequencerTriggerSource [Sequencer Set Selector] [Sequencer Path Selector]
Interface	IEnumeration
Access	RW
Visibility	Expert

Enumeration Values

9 Color Transformation Control

Note: To access color transformation controls, ISP must be enabled. The ISP enable feature is under the Image Format control (IspEnable).

A color transformation is a linear operation applied to input red, green, and blue values for each pixel, which are multiplied by a 3x3 matrix and then added to an offset triplet.

The equation, taking input RGB values and producing three output channels (C0, C1 and C2) is given by:

$$\begin{bmatrix} C0_{out} \\ C1_{out} \\ C2_{out} \end{bmatrix} = \begin{bmatrix} Gain00 & Gain01 & Gain02 \\ Gain10 & Gain11 & Gain12 \\ Gain20 & Gain21 & Gain22 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} Offset0 \\ Offset1 \\ Offset2 \end{bmatrix}$$

There are two available color transformations, **RGB to RGB** and **RGB to YUV**.

The **RGB to RGB** transform takes input in the camera's native RGB color space, which varies based on the properties of the camera and sensor. The RGB to RGB transform is usually used to convert from the camera's native color space to sRGB (standard RGB) color space. This operation is often called a Color Correction Matrix (CCM).

The RGB to RGB transform can be enabled/disabled. Select RGB to RGB with [Color Transformation Selector](#) and then set [Color Transformation Enable](#) to 0 (disabled) or 1 (enabled).

Use the [RGB Transform Light Source](#) to select the active RGB to RGB matrix from a set of pre-calibrated matrices optimized for different lighting conditions.

To set your own RGB to RGB matrix, select Custom [RGB Transform Light Source](#), and then use the features [Color Transformation Value Selector](#) and [Color Transformation Value](#) to set the Gain/Offset coefficients.

The **RGB to YUV** transform happens after the RGBtoRGB transform and after applying [Gamma](#). It is only available for YUV or YCbCr pixel formats, and it cannot be enabled or disabled, except by changing [Pixel Format](#).

For both RGB to RGB and RGB to YUV, the gain/offset values used can be queried by selecting a value with Color Transformation Value Selector and then reading its Color Transformation Value.

In addition to the RGB to RGB transform, the color of the image can also be adjusted with the [Saturation](#) control, when [Saturation Enable](#) is set to 1. Increasing [Saturation](#) makes the colors in the image more vivid.

9.1 Summary Table

Name	Interface	Access	Visibility	Description
Color Transformation Selector	IEnumeration		Beginner	Selects which Color Transformation module is controlled by the various Color Transformation features
Color Transformation Enable [Color	IBoolean		Beginner	Enables/disables the color transform selected with ColorTransformationSelector. For RGB to

Name	Interface	Access	Visibility	Description
Transformation Selector				YUV this is read-only. Enabling/disabling RGB to YUV can only be done by changing pixel format.
Color Transformation Value Selector [Color Transformation Selector]	IEnumeration			Selects the Gain factor or Offset of the Transformation matrix to access in the selected Color Transformation module
Color Transformation Value [Color Transformation Selector] [Color Transformation Value Selector]	IFloat			Represents the value of the selected Gain factor or Offset inside the Transformation matrix in floating point precision.
RGB Transform Light Source	IEnumeration		Expert	Used to select from a set of RGBtoRGB transform matrices calibrated for different light sources. Selecting a value also sets the white balance ratios (BalanceRatioRed and BalanceRatioBlue), but those can be overwritten through manual or auto white balance.
Saturation Enable	IBoolean		Beginner	Enables/disables Saturation adjustment.
Saturation	IFloat		Beginner	Controls the color saturation.

10 Chunk Data Control

Chunk Data allows you the ability to send additional information with the image data. This can be helpful when debugging issues or looking at what settings have been applied to the acquired image.

Use [ChunkModeActive](#) to enable chunk data for images.

The following information is available as chunk data:

- Image - enabled by default and cannot be disabled.
- Image CRC - enabled by default and cannot be disabled.
- FrameID
- OffsetX
- OffsetY
- Width
- Height
- Exposure Time
- Gain
- Black Level
- Pixel Format
- ImageTimestamp
- Sequencer Set Active

Use [ChunkSelector](#) to select a chunk then use [ChunkEnable](#) to enable or disable it. Image and ImageCRC cannot be disabled.

Once acquisition has started Chunk data can not be altered. To enable or disable chunks acquisition must be stopped.

10.1 Summary Table

Name	Interface	Access	Visibility	Description
Chunk Mode Active	IBoolean	RW	Expert	Activates the inclusion of Chunk data in the payload of the image.
Chunk Selector	IEnumeration	RW	Expert	Selects which chunk data to enable or disable.
Chunk Enable [Chunk Selector]	IBoolean	RW	Expert	Enables the inclusion of the selected Chunk data in the payload of the image.
Chunk Image	IInteger	RO	Expert	Returns the image payload.
Image CRC	IInteger	RO	Expert	Returns the CRC of the image payload.

Name	Interface	Access	Visibility	Description
Chunk Frame ID	Integer	RO	Expert	Returns the image frame ID.
Chunk Offset X	Integer	RO	Expert	Returns the Offset X of the image included in the payload.
Chunk Offset Y	Integer	RO	Expert	Returns the Offset Y of the image included in the payload.
Chunk Width	Integer	RO	Expert	Returns the width of the image included in the payload.
Chunk Height	Integer	RO	Expert	Returns the height of the image included in the payload.
Chunk Pixel Format	Enumeration		Expert	Format of the pixel provided by the camera
Chunk Exposure Time	Float	RO	Expert	Returns the exposure time used to capture the image.
Chunk Gain Selector	Enumeration		Expert	Selects which gain to retrieve
Chunk Gain [Chunk Gain Selector]	Float	RO	Expert	Returns the gain used to capture the image.
Chunk Black Level Selector	Enumeration		Expert	Selects which black level to retrieve
Chunk Black Level [Chunk Black Level Selector]	Float	RO	Expert	Returns the black level used to capture the image.
Chunk Timestamp	Integer	RO	Expert	Returns the Timestamp of the image.
Chunk Sequencer Set Active	Integer	RO	Expert	Returns the index of the active set of the running sequencer included in the payload.

10.2 Chunk Data Control Features

10.2.1 Chunk Mode Active

Activates the inclusion of Chunk data in the payload of the image.

Property	Value
Name	ChunkModeActive

Returns the index of the active set of the running sequencer included in the payload.

Property	Value
Name	ChunkSequencerSetActive
Interface	Integer
Access	RO
Unit	
Visibility	Expert

10 Test Control

Test Control provides functionality to allow certain features to be exercised.

There are two features available in Test Control:

TestEventGenerate - This feature allows you to generate test events. Executing sends a single TestEvent, which then populates the Event Test Data selector with the ID and the timestamp of when the event occurred.

TestPendingAck - This feature allows you to test the device's pending acknowledge feature. When this feature is written, the device waits for the corresponding time period in milliseconds before acknowledging the write.

Test0001 - This feature is for internal testing only.

If a test fails, an error is produced for the log.

10.1 Summary Table

Name	Interface	Access	Visibility	Description
Test Pending Ack	IInteger	RW	Guru	Test PENDING_ACK feature.
Test Event Generate	ICommand	WO	Guru	This command generates a test event and sends it to the host.
Test 0001	IInteger	RW	Expert	For testing only.

11 Digital IO Control

The camera is equipped with a 6-pin GPIO connector on the back of the case. The connector is a Hirose HR10A-7R-6PB, the mating connector is a Hirose HR10A-7P-6S(73).

Diagram	Color	Pin	Line	Function	Description
	Green	1	3	Power / Input	+12 V DC Camera Power / Non-isolated input
	Black	2	0	Opto Input 1	Opto-isolated input
	Red	3	2	NC / +3.3 V / GPIO	+3.3 V output. Current 120 mA (nominal) Firmware enabled / Non-isolated I/O
	White	4	1	Opto Output 1	Opto-isolated output
	Blue	5	N/A	Opto GND	Ground for opto-isolated I/O, not connected to camera ground
	Brown	6	N/A	GND	DC camera power ground

This section describes how to configure the camera's general purpose digital input and outputs (sometimes referred to as GPIO).

Use [LineSelector](#) to choose which of the 4 lines to configure. All the features listed beneath it are controllable on a per line basis.

Use [Line Mode](#) to control the direction - either **Input** or **Output** - of the selected I/O line.

Use [3.3V Enable](#) to supply external circuits with power. This is different than standard logic outputs in that it is comparatively slow to switch but can supply a more significant amount of power. This is only available on some pins.

Use [LineInverter](#) to control a logic inverter on the selected line.

[LineStatus](#) indicates the current status of the selected line. A checked status (enabled) indicates logic high. An unchecked status (disabled) indicates logic low. Since this node must be polled to get its status it should not be used as a real time control for reading internal signals.

[LineStatusAll](#) is a hexadecimal representation of all the line status bits (Line 0 status corresponds to bit 0, Line 1 status with bit 1, etc). This allows simultaneous reading of all line statuses at once.

Use the [LineInputFilterSelector](#) to choose a filter. Filters are unique per line. Use [LineFilterWidth](#) to set the width of the filter in microseconds. There are two choices of filter:

Degitch - designed to filter out any noise or other spurious signals on the line, it does not consider the state to have transitioned until after the Filter Width time has expired. This means that Deglitch introduces a delay in the signal.

Debounce - designed to filter out rapid connecting and disconnecting common in mechanical switches. This means that Debounce considers the first edge as valid and won't allow a subsequent change of state until after the debounce time has elapsed.

Note: The Deglitch filter is applied before Debounce filter.

Use [LineSource](#) to control what signal is output on the line when the Line Mode is set to output. The choices are:

Other Lines - creates a loop back

User Outputs - outputs user controllable internal signals

Counter Active - shows when a counter is in use

Logic Blocks - drives the lines

Exposure Active - indicates when the image sensor is exposing

Frame Trigger Wait - indicates when the camera is ready to accept a new Frame Start trigger

If a User Output is selected as a Line Source, use [UserOutputSelector](#) to select which bit to use as internal signals within the camera. Use [UserOutputValue](#) to set the selected user output to logic high (enabled) or logic low (disabled).

[UserOutputValueAll](#) is a hexadecimal representation of all the user output bits (User Output 0 corresponds to bit 0, User Output 1 with bit 1, etc). Reading or writing User Output Value All allows simultaneous setting or reading of all user outputs at once.

[LineFormat](#) is read only and indicates what type of circuit the selected line has. The options for Line Format are:

Tri State - indicates the line is not driven. This is typical for digital inputs.

Opto Coupled - indicates that an opto isolator is being used to isolated the external circuitry from the internal camera electronics.

Open Drain - indicates there is an internal MOSFET that will pull the pin low but requires an external pull up resistor to produce a logic level high signal. This is typical for digital outputs.

11.1 Summary Table

Name	Interface	Access	Visibility	Description
Line Selector	IEnumeration		Expert	Selects the physical line (or pin) of the external device connector to configure
Line Mode [Line Selector]	IEnumeration		Expert	Controls if the physical Line is used to Input or Output a signal.
3.3V Enable [Line Selector]	IBoolean	RW	Guru	Internally generated 3.3V rail. Enable to supply external circuits with power. This is different than standard logic outputs in that it is comparatively slow to switch but can supply a more significant amount of power. This is only available on some pins.
Line Inverter [Line Selector]	IBoolean	RW	Expert	Controls the inversion of the signal of the selected input or output line.

Name	Interface	Access	Visibility	Description
Line Status [Line Selector]	IBoolean	RO	Expert	Returns the current status of the selected input or output Line
Line Status All	IInteger	RO	Expert	Returns the current status of all the line status bits in a hexadecimal representation (Line 0 status corresponds to bit 0, Line 1 status with bit 1, etc). This allows simultaneous reading of all line statuses at once.
Input filter Selector [Line Selector]	IEnumeration		Expert	Selects the kind of input filter to configure: Deglitch or Debounce.
Line Filter Width [Input filter Selector]	IFloat		Expert	Filter width in microseconds for the selected line and filter combination
Line Source [Line Selector]	IEnumeration		Expert	Selects which internal acquisition or I/O source signal to output on the selected line. LineMode must be Output.
Line Format [Line Selector]	IEnumeration	RO	Expert	Displays the current electrical format of the selected physical input or output Line.
Exposure Active Mode	IEnumeration	RW	Expert	Control sensor active exposure mode.
User Output Selector	IEnumeration		Expert	Selects which bit of the User Output register is set by UserOutputValue.
User Output Value [User Output Selector]	IBoolean	RW	Expert	Value of the selected user output, either logic high (enabled) or logic low (disabled).
User Output Value All	IInteger		Expert	Returns the current status of all the user output status bits in a hexadecimal representation (UserOutput 0 status corresponds to bit 0, UserOutput 1 status with bit 1, etc). This allows simultaneous reading of all user output statuses at once.

12 Counter And Timer Control

The Counter and Timer control feature allows you to:

- Create a function generator
- Keep a count of how many times a signal has fired.

Use the CounterSelector to select a counter, either 0 or 1.

Use CounterEventSource to select the event to increment the counter. Possible counter event sources include:

- MHz Tick
- Line Inputs
- User Outputs
- Counter Starts
- Counter Ends
- Logic Block Outputs
- Exposure Start
- Exposure End
- Frame Trigger Wait

When the selected source allows for signal activation, use CounterEventActivation to specify Level Low, Level High, Falling Edge, Rising Edge, or Any Edge.

Use CounterDelay to indicate the maximum number of counts that need to occur before generating the Counter Start event.

Use CounterDuration to indicate the maximum number of counts that need to occur before generating the Counter End event.

Note: Only one of CounterTriggerSource or CounterResetSource can be active at a time. Selecting one disables the other.

Use CounterTriggerSource to select the event to start the counter. Possible counter trigger sources include:

- MHz Tick
- Line Inputs
- User Outputs
- Counter Starts
- Counter Ends
- Logic Block Outputs
- Exposure Start

- Exposure End
- Frame Trigger Wait

When the selected source allows for signal activation, use CounterTriggerActivation to specify Level Low, Level High, Falling Edge, Rising Edge, or Any Edge.

Use CounterResetSource to select the event to end the counter. Possible counter reset sources include:

- MHz Tick
- Line Inputs
- User Outputs
- Counter Starts
- Counter Ends
- Logic Block Outputs
- Exposure Start
- Exposure End
- Frame Trigger Wait

When the selected source allows for signal activation, use CounterResetActivation to specify Level Low, Level High, Falling Edge, Rising Edge, or Any Edge.

CounterValue indicates the current counter while CounterStatus indicates the current status. CounterValueAtReset indicates the counter's value when a reset occurred.

12.1 Summary Table

Name	Interface	Access	Visibility	Description
Counter Selector	IEnumeration		Expert	Selects which counter to configure
Counter Event Source [Counter Selector]	IEnumeration	RW	Expert	Selects the event that will increment the counter
Counter Event Activation [Counter Selector]	IEnumeration	RW	Expert	Selects the activation mode of the event to increment the Counter.
Counter Duration [Counter Selector]	IInteger		Expert	Sets the duration (or number of events) before the CounterEnd event is generated.
Counter Value [Counter Selector]	IInteger	RO	Expert	Current counter value
Counter Value At Reset [Counter Selector]	IInteger	RW	Expert	Value of the selected Counter when it was reset by a trigger.
Counter Trigger Source [Counter Selector]	IEnumeration	RW	Expert	Selects the source of the trigger to start the counter

Name	Interface	Access	Visibility	Description
Counter Trigger Activation [Counter Selector]	IEnumeration	RW	Expert	Selects the activation mode of the trigger to start the Counter.
Counter Reset Source [Counter Selector]	IEnumeration	RW	Expert	Selects the signal that will be the source to reset the Counter.
Counter Reset Activation [Counter Selector]	IEnumeration	RW	Expert	Selects the Activation mode of the Counter Reset Source signal.
Counter Status [Counter Selector]	IEnumeration	RO	Expert	Returns the current status of the Counter.
Counter Delay [Counter Selector]	IInteger		Expert	Sets the delay (or number of events) before the CounterStart event is generated.

13 Logic Block Control

For more detail, see [TAN2016005 Using Logic Blocks](#)

A Logic Block is a collection of combinatorial logic and latches that allows the user to create new, custom signals inside the camera. Each Logic Block is comprised of 2 lookup tables (LUT) with programmable inputs, truth tables and a flip flop output. There is a LUT for both the D input (Value LUT) and the enable input (Enable LUT) of the flip flop. Both LUTs have 3 inputs and thus have 8 configuration bits for their truth table.

To configure the LUTs first select either the Value or Enable LUT using the LogicBlockLUTSelector, then use the LogicBlockLUTInput to configure the different inputs into the LUT - note that the Value and Enable LUT share the inputs so setting the inputs on one will affect the other. The LogicBlockLUTInputSource selects the internal signal to be used and the LogicBlockLUTInputActivation selects what level or edge to be considered a positive input into the LUT. Once the inputs to the LUT have been selected the entries in the truth table can be configured either individually using the LogicBlockLUTRowIndex and LogicBlockLUTOutput or all at once using the LogicBlockLUTOutputValueAll

The following truth table shows a simple AND of Input1 and Input2 while Input0 is not considered ("DON'T CARE").

Source			Output
2	1	0	
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	0
1	0	0	0
1	0	1	0
1	1	0	1
1	1	1	1

To program this function into a LUT write the value of 0xC0 (1100 0000b) to the LogicBlockLUTOutputValueAll.

The details of the output Flip Flop output are shown in the following table. The previous value of the Value LUT will remain on the output until the Enable LUT is set at which point the output will be updated to the new value of the Value LUT. This allows latching of a given signal. To effectively bypass the output latch and pass the Value LUT signal through continuously simple program the Enable LUT truth table to all 1's (LogicBlockLUTOutputValueAll = 0xFF)

13.1 Summary Table

Name	Interface	Access	Visibility	Description
Logic Block Selector	IEnumeration		Guru	Selects which LogicBlock to configure
Logic Block LUT Selector [Logic Block Selector]	IEnumeration		Guru	Selects which LogicBlock LUT to configure

14 LUT Control

Lookup Table (LUT) is a common image processing technique to map a pixel from one value to the other. The camera has an 11-bit input lookup table that produces 9-bit output. When a pixel value is larger than the 11-bit maximum (i.e., 2047), LUT treats it the same as the 2047. The LUT is available for all pixel formats.

- When outputting 8-bit pixel formats, the 9-bit LUT output is rounded down to the 8-bit value.
- When outputting 12-bit pixel formats, the 9-bit LUT output stays as the most significant 9 bits of the 12-bit value and the remaining 3 bits are all zeros.
- When outputting 16-bit pixel formats, the 9-bit LUT output stays as the most significant 9 bits of the 16-bit value and the remaining 7 bits are all zeros.

Therefore, LUT should be used cautiously for 12-bit or 16-bit pixel formats since some of the least significant bits are thrown away.

The factory default LUT is the linear mapping after the camera powers on ($P' = P/4$).

To customize a LUT:

1. Use the [LUT Selector](#) to choose which LUT to control. LUT1 is the only lookup table to allow user access and control.
2. Use [LUT Enable](#) to disable the selected LUT before customizing it. Customizations of the LUT apply immediately, therefore an active LUT that is changed may result in unexpected images.
3. Use [LUT Index](#) to identify the index (offset) of the coefficient to access.
4. [LUT Value](#) returns the value at the entry of the LUT Index. Enter the new value.
5. Repeat steps 3 and 4 as necessary.
6. Enable LUT to have changes take effect.

For coding purposes, [LUT Value All](#) provides access to all the LUT coefficients in a single string without using an individual LUT Index.

Since only one LUT is available for users to access and control, in RGB and YUV pixel formats, the same LUT applies to all three channels (i.e., red, green and blue). In monochrome and Bayer formats, there is a single channel, regardless of the color or monochrome image sensor.

Note that the customized LUT is not saved into the camera permanently. After power cycling, the LUT returns to the factory default.

14.1 Summary Table

Name	Interface	Access	Visibility	Description

15 Auto Algorithm Control

15.1 Auto Exposure (AE)

Auto exposure (AE) control is designed to automatically determine the exposure time and gain of the camera so that the resulting image looks as bright as expected. In general, the camera supports various auto exposure features, and these features produce different results in the final image. In addition, the camera allows users to control how fast the exposure and gain get settled.

Note that for AE to work, [Exposure Auto](#) and/or [Gain Auto](#) must be set to Once or Continuous.

15.1.1 Auto Exposure Features

To enable AE, [Exposure Auto](#) and/or [Gain Auto](#) must be set to Once or Continuous. AE automatically determines the exposure time and/or gain according to the target image average.

The target image average can be manually or automatically controlled.

For **manual** control, set [Target Grey Value Auto](#) to Continuous and then set the desired image average in [Target Grey Value](#). This value is a percentage of the maximum pixel value.

For **automatic** control, set [Target Grey Value Auto](#) to Off. The target image average is then automatically determined according to user-defined AE modes and other AE features.

By default, AE uses the full range of exposure time and/or gain and target grey value, but these can be limited.

[Exposure Time Lower Limit](#) / [Exposure Time Upper Limit](#) - the lower and upper values in microseconds (μ s) that the exposure time may reach when exposure is set to Once or Continuous.

[Gain Lower Limit](#) / [Gain Upper Limit](#) - the lower and upper values in decibels (dB) that the gain may reach when gain is set to Once or Continuous.

[Target Grey Value Lower Limit](#) / [Target Grey Value Upper Limit](#) - the lower and upper values in percent (%) that the target image average may reach.

[Auto Exposure Damping](#) controls how fast the exposure and gain get settled. A small damping value may result in the system being unstable. The range is from 0.0 - 1.0. The default value is 0.5.

If both exposure time and gain are set to Once or Continuous AE determines which to adjust first by the [Auto Exposure Control Priority](#).

If **gain** priority is selected, the camera sets the gain to 0 dB, and the exposure is adjusted according to the target grey level. If the maximum exposure is reached before the target grey level is hit, the gain starts to change to meet the target. This mode is used to have the minimum noise.

If **exposure** priority is selected, the camera sets the exposure to a small value (default is 5 ms). The gain is adjusted according to the target grey level. If maximum gain is reached before the target grey level is hit, the exposure starts to change to meet the target. This mode is used to capture fast motion.

AE Lighting Mode can compensate for strong light sources in front or behind an object. The options are: Backlight, Frontlight, or Normal. The default lighting mode is Normal. Use the [Lighting Mode](#) feature to select depending on your conditions.

15.1.1.1 Backlight Compensation

The backlight compensation mode is used when a strong light is coming from the back of the object. For example, people standing in the shade with the bright sky at the back. A regular auto exposure algorithm makes the object underexposed in such lighting conditions. Backlight compensation is able to properly expose the object when a strong backlight occurs, regardless of the locations of the object relative to the frame.

15.1.1.2 Excessive Frontlight Compensation

The excessive frontlight compensation mode is used when a strong light is shining in the front of the object while the background is dark. For example, a parking spot that has lights on at night while its surrounding areas are very dark. A regular auto exposure algorithm makes the object overexposed in such lighting conditions. Frontlight compensation is able to properly expose the object when a strong front light and a dark background appear, regardless of the locations of the object relative to the frame.

15.1.1.3 Normal Lighting

If the object of interest in the frame is not under backlight or frontlight conditions, then normal lighting should be used. Select Normal lighting mode to make Metering Mode available.

AE Metering Mode is available only if [Lighting Mode](#) is set to Normal. The options are: Average, Spot, and Partial. The default AE metering mode is Average. Use the [Metering Mode](#) feature to select depending on your conditions.

15.1.1.4 Average Metering

This mode measures the light from the entire scene uniformly to determine the final exposure value. Every portion of the exposed area has the same contribution.

15.1.1.5 Spot Metering

This mode measures the light from a small area (about 3%) in the center of the scene while the rest of the scene is ignored. This mode is used when the scene has a high contrast and the object of interest is relatively small.

15.1.1.6 Partial Metering

This mode measures the light from a larger area (about 11%) in the center of the scene. This mode is used when very dark or bright regions appear at the edge of the frame.

A **region of interest** (ROI) can be applied to the auto exposure features. This AE ROI can be equal to or smaller than the area of the captured ROI. To use AE ROI:

1. Set the [ROI Selector](#) to Auto Exposure.
2. Turn on [ROI Enable](#).
3. Set the horizontal and vertical offsets (relative to the ROI being captured) with [ROI Offset X](#) and [ROI Offset Y](#).
4. Set the width and height with [ROI Width](#) and [ROI Height](#).

[EV Compensation](#) allows you to adjust the resultant image intensity with one control. Positive EV compensation makes the image brighter while negative EV compensation makes the image darker. The range is from -3 to 3 with a step of 1/3. The default value is 0.

15.2 Auto White Balance

When [White Balance Auto](#) is set to Continuous or Once the camera automatically adjusts the values of [Balance Ratio](#) Red and Blue to achieve good color balance. It is used to compensate for color shifts in the image caused by different lighting conditions.

There are two profiles of auto white balance: Indoor and Outdoor. These are selected with [White Balance Auto Profile](#).

In the **Outdoor** profile, the values of the red and blue balance ratios are restricted to a set of expected values for normal outdoor lighting conditions (i.e., daylight).

In the **Indoor** profile, the values of the red and blue balance ratios can take any values within specified limits. This allows auto white balance to compensate for artificial lighting such as fluorescent lights that are more greenish than daylight. The Indoor profile can also be used for outdoor conditions, since it does not place restrictions on the white balance solution.

By default, auto white balance uses the full range of balance ratios, but these can be limited.

- [White Balance Auto Lower Limit](#) / [White Balance Auto Upper Limit](#) - the lower and upper values that auto white balance can set for the red and blue balance ratios.

[White Balance Auto Damping](#) controls the speed at which auto white balance adjusts the values of the red and blue balance ratios. The range is from 0 to 1. Higher values of damping result in the white balance changing more gradually.

By default auto white balance examines all of the pixels in the image, but it can also use a region of interest (ROI). A common use for an auto white balance ROI is placing a white object in the image and then specifying the ROI on that object. To use ROI:

1. Set the [ROI Selector](#) to Auto White Balance.
2. Turn on [ROI Enable](#).
3. Set the horizontal and vertical offsets (relative to the ROI being captured) with [ROI Offset X](#) and [ROI Offset Y](#).
4. Set the width and height with [ROI Width](#) and [ROI Height](#).

15.3 Summary Table

Name	Interface	Access	Visibility	Description

16 Event Control

16.0.1 Event Features

Events allow you to get notified when the camera has performed something you might find interesting. Events are similar to the asynchronous communication but the difference is the initiator is the device.

Once an event is turned on, it has its own XML area where it outputs the event's ID, timestamp, and any applicable event data.

Use [EventSelector](#) to choose an event, then use [EventNotification](#) to set the event On or Off.

The possible events to choose are:

Exposure End - Event is sent every image when exposure end occurs. Event data includes: the event ID, timestamp, and frame ID.

Error - Event is sent every time an error occurs internally in the device. Event data includes: the event ID, timestamp, frame ID, and error code.

In order to verify that events are working, there is a [TriggerEventTest](#) command which allows you to trigger the camera to send a test event out.

Event Test - Event you can trigger to verify events are working properly. This is always enabled. Event data includes: exposure end ID and exposure end timestamp.

16.1 Summary Table

Name	Interface	Access	Visibility	Description
Event Selector	IEnumeration	RW	Expert	Selects which Event to enable or disable.
Event Notification [Event Selector]	IEnumeration	RW	Expert	Enables/Disables the selected event.
Event Exposure End Data	ICategory	RO	Expert	Category that contains all the data features related to the Exposure End Event.
Event Error Data	ICategory	RO	Expert	Category that contains all the data features related to the Error Event.
Event Test Data	ICategory	RO	Expert	Category that contains all the data features related to the Test Event.

16.2 Event Control Features

16.2.1 Event Selector

Selects which Event to enable or disable.

Property	Value
Name	EventSelector
Interface	IEnumeration
Access	RW
Visibility	Expert

Enumeration Values

Error
ExposureEnd

16.2.2 Event Notification

Enables/Disables the selected event.

Property	Value

Visibility	Expert

16.2.5 Event Test Data

Category that contains all the data features related to the Test Event.

Property	Value
Name	EventTestData
Interface	ICategory
Access	RO
Visibility	Expert

16.3 Event Exposure End Data

Category that contains all the data features related to the Exposure End Event.

16.3.1 Summary Table

Name	Interface	Access	Visibility	Description
Event Exposure End	Integer	RO	Expert	Returns the unique identifier of the Exposure End type of Event.
Event Exposure End	Integer	RO	Expert	Returns the Timestamp of the Exposure End Event.

Name	Interface	Access	Visibility	Description
Timestamp				
Event Exposure End Frame ID	Integer	RO	Expert	Returns the unique identifier of the frame (or image) that generated the Exposure End Event.

16.3.2 Event Exposure End Data Features

16.3.2.1 Event Exposure End

Returns the unique identifier of the Exposure End type of Event.

Property	Value
Name	EventExposureEnd
Interface	Integer
Access	RO
Unit	
Visibility	Expert
Value	0x9C43

16.3.2.2 Event Exposure End Timestamp

Returns the Timestamp of the Exposure End Event.

Property	Value
Name	EventExposureEndTimestamp
Interface	Integer
Access	RO
Unit	
Visibility	Expert

16.3.2.3 Event Exposure End Frame ID

Returns the unique identifier of the frame (or image) that generated the Exposure End Event.

Property	Value
Name	EventExposureEndFrameID

Property	Value
Interface	Integer
Access	RO
Unit	
Visibility	Expert

16.4 Event Error Data

Category that contains all the data features related to the Error Event.

16.4.1 Summary Table

Name	Interface	Access	Visibility	Description
Event Error	Integer	RO	Expert	Returns the unique identifier of the Error type of Event.
Event Error Timestamp	Integer	RO	Expert	Returns the Timestamp of the Error Event.
Event Error Frame ID	Integer	RO	Expert	Returns the unique identifier of the frame (or image) that generated the Error Event.
Event Error Code	Integer	RO	Expert	Returns the error code for the error that happened.

16.4.2 Event Error Data Features

16.4.2.1 Event Error

Returns the unique identifier of the Error type of Event.

Property	Value
Name	EventError
Interface	Integer
Access	RO
Unit	
Visibility	Expert
Value	0x9C40

16.4.2.2 Event Error Timestamp

Returns the Timestamp of the Error Event.

Property	Value
Name	EventErrorTimestamp
Interface	IInteger
Access	RO
Unit	
Visibility	Expert

16.4.2.3 Event Error Frame ID

Returns the unique identifier of the frame (or image) that generated the Error Event.

Property	Value
Name	EventErrorFrameID
Interface	IInteger
Access	RO
Unit	
Visibility	Expert

16.4.2.4 Event Error Code

Returns the error code for the error that happened.

Property	Value
Name	EventErrorCode
Interface	IInteger
Access	RO
Unit	
Visibility	Expert

16.5 Event Test Data

Category that contains all the data features related to the Test Event.

16.5.1 Summary Table

Name	Interface	Access	Visibility	Description
Event Test	IInteger	RO	Expert	Returns the unique identifier of the Exposure End type of Event.
Event Test Timestamp	IInteger	RO	Expert	Returns the Timestamp of the Exposure End Event.

16.5.2 Event Test Data Features

16.5.2.1 Event Test

Returns the unique identifier of the Exposure End type of Event.

Property	Value
Name	EventTest
Interface	IInteger
Access	RO
Unit	
Visibility	Expert
Value	0x4FFF

16.5.2.2 Event Test Timestamp

Returns the Timestamp of the Exposure End Event.

Property	Value
Name	EventTestTimestamp
Interface	IInteger
Access	RO
Unit	
Visibility	Expert

17 User Set Control

Features in the User Set Control category allow you to save camera settings to non-volatile memory so that they can be restored to a known state at any time (after the camera has been restarted).

17.1 Types of User Sets

You can select which user set to configure, save, or load with the [UserSetSelector](#) feature. There are two classes of user sets.

- User-defined settings
- Factory-defined settings. A factory-defined Default user set is always available. It represents a typical use case for the camera.

If the factory-defined settings are not ideal, they can be used as a starting point. From there, only a few features may need to be modified to achieve the desired configuration. The [UserSetSave](#) feature saves the current camera settings so that they can be recreated later. Once saved, these new custom settings can be loaded at any time.

The [UserSetLoad](#) feature loads the specified user set. Note that one can load a set without first saving. In this situation, the user set contents are the factory-defined default settings.

17.2 Start-up User Set

The [UserSetDefault](#) feature is used to configure a camera automatically at start-up. This loads the selected user set at start-up time. By default, it applies the factory-defined Default settings. However, you can change it to any user set so that the next time the camera restarts, it comes up with the selected user set.

17.3 User Set Managed Features

Due to limited on-board non-volatile memory, not all features are supported by user sets. See [UserSetFeatureSelector](#) for the list of all features that are supported. Features that are not listed are either of single session nature or are managed explicitly via other features, such as [Defect Table Save](#).

17.4 User Set Conversion

The exact list of features managed by user sets may change between different versions of firmware. Consequently, there may not be a perfect match between the set of features saved to non-volatile memory and the set of features handled by the current version of firmware. In this situation, the camera performs any necessary conversions on all saved user sets. This happens automatically the first time the camera is restarted after a firmware update. The conversion performed depends on the nature of the feature discrepancy:

- Obsolete features - Saved features that are no longer supported in the current firmware. These features are ignored and removed from all subsequently saved user sets.

- Missing features - Saved user sets do not have features that are supported in the current firmware. These missing feature values are filled in using one of the factory-defined sets. If [UserSetDefault](#) points to a user-defined set, then the missing feature values are copied from the factory-defined Default set.

17.5 Summary Table

Name	Interface	Access	Visibility	Description
User Set Selector	IEnumeration	RW	Beginner	Selects the feature User Set to load, save or configure.
User Set Load [User Set Selector]	ICommand	RW	Expert	Loads the User Set specified by UserSetSelector to the device and makes it active.
User Set Save [User Set Selector]	ICommand	RW	Beginner	Saves the User Set specified by UserSetSelector to the non-volatile memory of the device.
User Set Default	IEnumeration	RW	Beginner	Selects the feature User Set to load and make active by default when the device is restarted.
User Set Feature Selector	IEnumeration	RW	Expert	List of features that are saved to user sets.

17 File Access

17.1 File Access

The file access interface allows access to the cameras file system.

It provides access to the cameras user set files, LUT files and a user definable file.

Usage of the file access features and registers should not be attempted directly. Instead access the file system through the file access interface of the host application.

The user set files are treated differently than the other files in the system. These file when uploaded will modify the user set setting within the camera. If the user set file is from an older version of the camera or a different model, the user sets with in the file will be converted to the appropriate user sets for the new firmware. The file will then be replaced with the updated user set file. If the file contains user sets that are not appropriate for the firmware version on the camera, they will be ignored and discarded. If the file has been modified in any way, the file will be discarded and regenerated.

While a file is open within the file access interface, the camera will not be able to start acquisition. Also, the FileAccessExecute command will be disabled when the camera is in acquisition mode. Care should be taken to not leave any file open within the camera's file system as it will disable the start acquisition register without any feedback as to why.

17.2 Summary Table

Name	Interface	Access	Visibility	Description
File Selector	IEnumeration	RW	Guru	Selects which file is being operated on. This must be set before performing any file operations.
File Operation Selector	IEnumeration	RW	Guru	Sets operation to execute on the selected file when the execute command is given.
File Operation Execute	ICommand	WO	Guru	This is a command that executes the selected file operation on the selected file.
File Open Mode	IEnumeration	RW	Guru	The mode of the file when it is opened. The file can be opened for reading, writing or both. This must be set before opening the file.
File Access Buffer	IRegister	RW	Guru	Defines the intermediate access buffer that allows the exchange of data between the device file storage and the application.
File Access Offset	IInteger	RW	Guru	Controls the Offset of the mapping between the device file storage and the FileAccessBuffer.
File Access	IInteger	RW	Guru	Controls the Length of the mapping between the device

Name	Interface	Access	Visibility	Description
Length				file storage and the FileAccessBuffer.
File Operation Status	IEnumeration	RO	Guru	Represents the file operation execution status.
File Operation Result	Integer	RO	Guru	Represents the file operation result. For Read or Write operations, the number of successfully read/written bytes is returned.
File Size	Integer	RO	Guru	Represents the size of the selected file in bytes.

17.3 File Access Features

17.3.1 File Selector

Selects which file is being operated on. This must be set before performing any file operations.

Property Value

Name	FileSelector
Interface	IEnumeration
Access	RW

17.3.8 File Operation Status

Represents the file operation execution status.

Property	Value
Name	FileOperationStatus
Interface	IEnumeration
Access	RO
Visibility	Guru

Enumeration Values

Success
Failure

17.3.9 File Operation Result

Represents the file operation result. For Read or Write operations, the number of successfully read/written bytes is returned.

Property	Value
Name	FileOperationResult
Interface	IInteger
Access	RO
Unit	
Visibility	Guru

17.3.10 File Size

Represents the size of the selected file in bytes.

Property Value

Name	FileSize
Interface	Integer
Access	RO
Unit	B
Visibility	Guru

18 Transfer Control

The Transfer Control category contains features that control the transferring of image data to the host.

An acquisition generates frames that are optionally processed and may have extra data appended (chunk data) before being placed in the transfer queue for transmission out of the device. Once the image data has gone through any processing and had the appropriate data appended it is referred to as a block. These blocks are then handed to the transfer module to be sent out of the device on data streams. The transfer module then transmits these blocks externally on stream channels.

This can be manually or automatically controlled. Use the [Transfer Control Mode](#) to select the control method. There are three options: **Basic**, **Automatic**, and **User Controlled**.

In both **Basic** and **Automatic** mode the camera starts transmitting data as soon as there is enough data to fill a link layer packet. This reduces the latency between when the image was acquired and when it is available to the user. As long as the link layer is able to transfer data blocks faster than they are being generated the camera continuously sends one image after another on the stream channel.

There is a **Transfer Queue** which starts to fill up if the link slows down.

The [Transfer Queue Max Block Count](#) indicates the transfer queue's maximum capacity.

The [Transfer Queue Current Block Count](#) indicates the number of blocks currently in the transfer queue.

The [Transfer Queue Overflow Count](#) indicates the number of blocks that have been lost before being transmitted.

The [Transfer Queue Mode](#) indicates the mechanism for transmitting and overwriting blocks in the transfer queue. It is First In First Out, which means the oldest block in the queue is always sent next on the stream channel.

Once the transfer queue is full the camera overwrites the oldest block in the queue with the new block arriving from the acquisition and processing modules that has not already begun being transmitted. At this point the Queue Overflow is incremented. Once the image that is currently being transmitted finishes, the transmission module transmits the next oldest image in the transfer queue.

In **User Controlled** mode you can directly control the transfer of blocks. Use the Transfer Operation Mode to select an operation mode. There are two options: **Continuous** and **Multi Block**.

Continuous sends images without stopping in the same manner as Basic/Automatic, but you can use [Transfer Start](#) and [Transfer Stop](#) to control the streaming while acquisition runs independently.

Multi Block transmits a specified number of blocks and then stops. Use the [Transfer Block Count](#) to specify the number of blocks. Use the [Transfer Start](#) command to initiate a multi block transfer.

Note: Acquisition can be started and stopped without affecting the transfer queue or transfer state however closing the stream channel clears both the queue and any pending transmissions.

18.1 Summary Table

Name	Interface	Access	Visibility	Description
Transfer	IEnumeration	RW	Expert	Selects the control method for the transfers. Basic and

Name	Interface	Access	Visibility	Description
Control Mode				Automatic start transmitting data as soon as there is enough data to fill a link layer packet. User Controlled allows you to directly control the transfer of blocks.
Transfer Operation Mode	IEnumeration	RW	Expert	Selects the operation mode of the transfer. Continuous is similar to Basic/Automatic but you can start/stop the transfer while acquisition runs independently. Multi Block transmits a specified number of blocks and then stops.
Transfer Block Count	IIInteger	RW	Expert	Specifies the number of data blocks (images) that the device should stream before stopping. This feature is only active if the Transfer Operation Mode is set to Multi Block.
Transfer Queue Max Block Count	IIInteger	RO	Expert	Returns the maximum number of data blocks (images) in the transfer queue
Transfer Queue Current Block Count	IIInteger	RO	Expert	Returns number of data blocks (images) currently in the transfer queue.
Transfer Queue Overflow Count	IIInteger	RO	Expert	Returns number of images that have been lost before being transmitted because the transmit queue hasn't been cleared fast enough.
Transfer Queue Mode	IEnumeration	RW	Expert	Specifies the operation mode of the transfer queue.
Transfer Start	ICommand	WO	Expert	Starts the streaming of data blocks (images) out of the device. This feature is available when the Transfer Control Mode is set to User Controlled.
Transfer Stop	ICommand	WO	Expert	Stops the streaming of data block (images). The current block transmission is completed. This feature is available when the Transfer Control Mode is set to User Controlled.

18.2 Transfer Control Features

18.2.1 Transfer Control Mode

Selects the control method for the transfers. Basic and Automatic start transmitting data as soon as there is enough data to fill a link layer packet. User Controlled allows you to directly control the transfer of blocks.

FirstInFirstOut

18.2.8 Transfer Start

Starts the streaming of data blocks (images) out of the device. This feature is available when the Transfer Control Mode is set to User Controlled.

Property	Value
Name	TransferStart
Interface	ICommand
Access	WO
Visibility	Expert

18.2.9 Transfer Stop

Stops the streaming of data block (images). The current block transmission is completed. This feature is available when the Transfer Control Mode is set to User Controlled.

Property	Value
Name	TransferStop
Interface	ICommand
Access	WO
Visibility	Expert

19 Defective Pixel Correction

The camera supports table-based defective pixel correction, where a list of defective pixel coordinates is specified, and the values of those pixels are replaced based on the values of their neighbors. The camera comes with a list of defective pixels calibrated during manufacturing (the factory default table), but you can update or replace this list.

[Defect Correct Static Enable](#) turns table-based defective pixel correction On or Off.

[Defect Correction Mode](#) controls the method used for replacing the value of pixels within the table. The options are Average or Highlight. Average replaces defective pixels with the average of their neighbors. Highlight is used for debugging purposes and sets pixels within the table to the maximum possible pixel value to highlight them.

19.1 Modifying the List of Defective Pixels

[Defect Correct Pixel Count](#) controls the number of defective pixels in the table.

[Defect Table Index](#) selects an individual pixel within the table. This is a zero-based index, so if there are N pixels in the table, the index range is from 0 to $N-1$. [Defect X Coordinate](#) and [Defect Y Coordinate](#) define the (X,Y) coordinates of the defective pixel selected by the index. These values can be changed. These (X,Y) coordinates are relative to the full image ROI, when [Offset X](#) and [Offset Y](#) are both zero.

Changes made to the defective pixel table using these controls do NOT take effect immediately. When the you have finished making a series of changes to the table, execute the command [Defect Table Apply](#) for the changes to affect images captured by the camera. This writes the table to volatile memory, so changes are lost if the camera loses power.

[Defect Table Save](#) saves the table to persistent storage within the camera, so that the modified table is loaded whenever the camera boots up. Saving overwrites the existing table stored in memory.

[Defect Table Factory Restore](#) resets the table to its factory default state. This completely overwrites any changes made to the table, both the active table used in images being captured by the camera and the table saved in memory.

Important Note: Because it takes time to download a full defect table, if the camera is streaming when a table is either applied or restored to factory default, the results may appear momentarily corrupted until the complete table is written to the FPGA.

19.1.1 Example: Adding a location to the Defective Pixel Table

These steps illustrate how to add a pixel to the table:

1. Set [Offset X](#) and [Offset Y](#) to zero, and [Width](#) and [Height](#) at least large enough so that the defective pixel falls within the image ROI.
2. Note the X and Y coordinates of the defective pixel under these ROI settings.
3. Increase [Defect Correct Pixel Count](#) by 1 to add a new defective pixel to the list.
4. Set [Defect Table Index](#) to the new value of [Defect Correct Pixel Count](#) minus 1, to control the last defective pixel in the table, which is the one that was just added.

5. Set the values of [Defect X Coordinate](#) and [Defect Y Coordinate](#) to the coordinates of the pixel being added.
6. Click [Defect Table Apply](#) to have the change affect images being captured.
7. Use [Defect Table Save](#) to save the modified table so that it is loaded every time the camera boots up.

19.2 Summary Table

Name	Interface	Access	Visibility	Description
Defect Correct Static Enable	IBoolean		Guru	Enables/Disables table-based defective pixel correction.
Defect Correction Mode	IEnumeration		Guru	Controls the method used for replacing defective pixels.
Defect Table Pixel Count	IInteger		Guru	The number of defective pixel locations in the current table.
Defect Table Index	IInteger		Guru	Controls the offset of the element to access in the defective pixel location table.
Defect X Coordinate [Defect Table Index]	IInteger		Guru	Returns the X coordinate of the defective pixel at DefectTableIndex within the defective pixel table. Changes made do not take effect in captured images until the command DefectTableApply is written.
Defect Y Coordinate [Defect Table Index]	IInteger		Guru	Returns the Y coordinate of the defective pixel at DefectTableIndex within the defective pixel table. Changes made do not take effect in captured images until the command DefectTableApply is written.
Defect Table Apply	ICommand	RW	Guru	Applies the current defect table, so that any changes made affect images captured by the camera. This writes the table to volatile memory, so changes to the table are lost if the camera loses power. To save the table to non-volatile memory, use DefectTableSave.
Defect Table Save	ICommand		Guru	Saves the current defective pixel table non-volatile memory, so that it is preserved when the camera boots up. This overwrites the existing defective pixel table. The new table is loaded whenever the camera powers up.
Defect Table Factory Restore	ICommand		Guru	Restores the Defective Pixel Table to its factory default state, which was calibrated during manufacturing. This permanently overwrites any changes made to the defect table.

19.3 Defective Pixel Correction Features

19.3.1 Defect Correct Static Enable

Enables/Disables table-based defective pixel correction.

Property	Value

Property	Value
Name	DefectTableIndex
Interface	Integer
Access	
Unit	
Visibility	Guru

19.3.5 Defect X Coordinate

Returns the X coordinate of the defective pixel at DefectTableIndex within the defective pixel table. Changes made do not take effect in captured images until the command DefectTableApply is written.

Property	Value
Name	DefectTableCoordinateX [Defect Table Index]
Interface	Integer
Access	
Unit	
Visibility	Guru

19.3.6 Defect Y Coordinate

Returns the Y coordinate of the defective pixel at DefectTableIndex within the defective pixel table. Changes made do not take effect in captured images until the command DefectTableApply is written.

Property	Value
Name	DefectTableCoordinateY [Defect Table Index]
Interface	Integer

Property	Value
Access	
Unit	
Visibility	Guru

19.3.7 Defect Table Apply

Applies the current defect table, so that any changes made affect images captured by the camera. This writes the table to volatile memory, so changes to the table are lost if the camera loses power. To save the table to non-volatile memory, use DefectTableSave.

Property	Value
Name	DefectTableApply
Interface	ICommand
Access	RW
Visibility	Guru

19.3.8 Defect Table Save

Saves the current defective pixel table non-volatile memory, so that it is preserved when the camera boots up. This overwrites the existing defective pixel table. The new table is loaded whenever the camera powers up.

Property	Value
Name	DefectTableSave
Interface	ICommand
Access	
Visibility	Guru

19.3.9 Defect Table Factory Restore

Restores the Defective Pixel Table to its factory default state, which was calibrated during manufacturing. This permanently overwrites any changes made to the defect table.

Property	Value
Name	DefectTableFactoryRestore
Interface	ICommand

Property	Value
Access	
Visibility	Guru

20 Flat Field Correction Control

Flat Field Correction (FFC) is used to suppress an image sensor Fixed Pattern Noise (FPN) which is a common image artifact for many CMOS sensors. FFC includes correction for both Dark Signal Non-Uniformity (DSNU) and Pixel Response Non-Uniformity (PRNU). The suppression for DSNU is achieved by black level correction and the suppression for PRNU is achieved by gain correction. A reference equation is given below:

$$P_n = \Delta G_n (U_n + \Delta O_n)$$

Where:

- n could be pixel, row or column index.
- P is the corrected pixel value.
- U is the uncorrected pixel value.
- ΔG is the delta gain (gain correction), which is row/column/pixel dependent.
- ΔO is the delta offset (black level correction), which is row/column/pixel dependent.

Note that our FFC is currently column dependent only since the column FPN is the dominant noise for all sensors we support.

20.0.1 Flat Field Correction Control

FFC can be enabled or disabled using [Flat Field Correction Enable](#). It is enabled by default.

Use [Flat Field Correction Mode](#) to select a mode. There are three FFC modes: Factory, User, and Calibration.

20.0.1.1 Factory mode

This is the default mode. In this mode, the camera uses the factory delta gain/offset parameters calibrated by FLIR.

The FFC coefficients change with different camera gain levels.

20.0.1.2 User mode

In this mode, the camera uses fixed FFC coefficients across all camera gain levels. The default values for this mode apply no FFC and are the equivalent of disabling FFC. To modify the values, you must switch to Calibration mode.

20.0.1.3 Calibration mode

In this mode, the Flat Field User Table Control access (R/W) is available. At the same time, FFC will be automatically disabled and become unavailable. Therefore, values entered for delta gain/offset do not take effect until the mode is switched to User and FFC is enabled again.

20.0.2 Flat Field User Table Control

When in Calibration mode, you can access these controls.

[Table x Coordinate](#) specifies the horizontal coordinate of the FFC gain/offset. The FFC implementation supports only the x coordinate, for suppressing the column FPN.

[Flat Field Gain](#) specifies the delta gain for each table x coordinate.

[Flat Field Offset](#) (16-bit) specifies the delta offset for each table x coordinate. The step size should be queried before writing the value as it is normally much greater than 1 (e.g., 32). Entering a value that is not divisible by the step size results in an error.

[User Table Reset](#) sets all FFC parameters back to the last saved values loaded from the camera. If nothing has been previously saved, this resets to the default values which is the equivalent of disabling FFC.

[User Table Save](#) saves the FFC parameters into non-volatile memory which is preserved even when the camera is power cycled. This overwrites the existing saved user table.

20.1 Summary Table

Name	Interface	Access	Visibility	Description
Flat Field Correction Enable	IBoolean		Beginner	Enable or disable flat field correction.
Flat Field Correction Mode	IEnumeration		Expert	Selects flat field correction mode. Note that flat field correction parameters are accessible only in Calibration mode. When switching modes from Calibration to User or Factory, it is recommended to stop image streaming to give the camera enough time to load the corresponding table.
Flat Field User Table Control	ICategory		Expert	Category that contains User flat field correction table control features.

20.2 Flat Field Correction Control Features

20.2.1 Flat Field Correction Enable

Enable or disable flat field correction.

Property Value

Name	FfcEnable
Interface	IBoolean
Access	
Visibility	Beginner

20.2.2 Flat Field Correction Mode

Selects flat field correction mode. Note that flat field correction parameters are accessible only in Calibration mode. When switching modes from Calibration to User or Factory, it is recommended to stop image streaming to give the camera enough time to load the corresponding table.

Property	Value
Name	FfcMode
Interface	IEnumeration
Access	
Visibility	Expert

Enumeration Values

Calibration

20.2.3 Flat Field User Table Control

Category that contains User flat field correction table control features.

Property	Value
Name	FfcUserTableControl
Interface	ICategory
Access	
Visibility	Expert

20.3 Flat Field User Table Control

Category that contains User flat field correction table control features.

20.3.1 Summary Table

Name	Interface	Access	Visibility	Description
Table X Coordinate	IInteger		Expert	Controls the pixel X coordinate of the user flat field correction coefficients.

Name	Interface	Access	Visibility	Description
Flat Field Gain [Table X Coordinate]	IFloat		Expert	The value of user flat field gain correction for the current pixel.
Flat Field Offset (16-bit) [Table X Coordinate]	Integer		Expert	The value of user flat field offset correction for the current pixel.
User Table Reset	ICommand	WO	Expert	Resets the user flat field correction table to the last saved values loaded from the camera. If nothing has been previously saved, this resets to the default values which is the equivalent of disabling FFC.
User Table Save	ICommand	WO	Expert	Saves the current User flat field correction table into the camera, which means the table is still available after a power cycle. Note that this overwrites the existing saved User table.

20.3.2 Flat Field User Table Control Features

20.3.2.1 Table X Coordinate

Controls the pixel X coordinate of the user flat field correction coefficients.

Property	Value
Name	FfcUserTableXCoordinate
Interface	Integer
Access	
Unit	
Visibility	Expert
Value	0

20.3.2.2 Flat Field Gain

The value of user flat field gain correction for the current pixel.

Property	Value
Name	FfcUserGain [Table X Coordinate]
Interface	IFloat

Property	Value
Access	
Unit	
Visibility	Expert

20.3.2.3 Flat Field Offset (16-bit)

The value of user flat field offset correction for the current pixel.

Property	Value
Name	FfcUserOffset [Table X Coordinate]
Interface	Integer
Access	
Unit	
Visibility	Expert

20.3.2.4 User Table Reset

Resets the user flat field correction table to the last saved values loaded from the camera. If nothing has been previously saved, this resets to the default values which is the equivalent of disabling FFC.

Property	Value
Name	FfcUserTableReset
Interface	ICommand
Access	WO
Visibility	Expert

20.3.2.5 User Table Save

Saves the current User flat field correction table into the camera, which means the table is still available after a power cycle. Note that this overwrites the existing saved User table.

Property	Value
Name	FfcUserTableSave
Interface	ICommand
Access	WO

Property	Value
Visibility	Expert
